Abstract

A k - $L(2,1)$ -labeling for a graph G is a function $f:V(G) \rightarrow \{0,1,\dots,k\}$ such that $|f(u)-f(v)| \geq 2$ whenever $uv \in E(G)$ and $|f(u)-f(v)| \geq 1$ whenever u and v are at distance two apart. The λ -number for G , denoted by $\lambda(G)$, is the minimum k over all k - $L(2,1)$ -labelings of G . In this paper, we show that $Br(2\ell, m, r) \leq 6$ for $\ell = 9$ or 11, which confirms Conjecture 6.1 stated in [X. Li, V. Mak-Hau, S. Zhou, The $L(2,1)$ -labelling problem for cubic Cayley graphs on dihedral groups, *J. Comb. Optim.* (2013) 25: 716-736] in the case when $\ell = 9$ or 11. Moreover, we show that $Br(2\ell, m, r) = 5$ if 1) either $\ell \equiv 0 \pmod{6}$, m is odd, $r = 3$, or 2) $\ell \equiv 0 \pmod{3}$, m is even (mod 2), $r = 0$.

Keywords

Graph Labeling, Brick Product Graph, $L(2,1)$ -Labeling, Frequency Assignment Problem

1. Introduction

Let $G = (V, E)$ be a graph. For two vertices u and v in G , the distance between u and v is the number of the edges of the shortest path between u and v . A k - $L(2,1)$ -labeling for a graph G is a function $f:V(G) \rightarrow \{0,1,\dots,k\}$ such that $|f(u)-f(v)| \geq 2$ whenever $uv \in E(G)$ and $|f(u)-f(v)| \geq 1$ whenever u and v are at distance two apart. The λ -number for G , denoted by $\lambda(G)$, is the minimum k over all k - $L(2,1)$ -labelings of G . This labeling problem of graphs was proposed by Griggs and Roberts [1] which is a variation of the frequency assignment problem introduced by Hale [2]. The frequency assignment problem asks for assigning frequencies to transmitters in a broadcasting network with the aim of avoiding undesired interference. One of the graph theoretical models of the frequency assignment problem is the notion of distance constrained labeling

of graphs [3] [4] [5].

The $L(2,1)$ -labeling problem was studied very extensively in the literature and has attracted much attention. Griggs and Yeh [6] proposed a conjecture, which is called the Δ^2 -conjecture, that $\lambda(G) \leq \Delta^2$ for any graph with $\Delta \geq 2$, where Δ is the maximum degree of G , and they also proved that $\lambda(G) \leq \Delta^2 + 2\Delta$. Later, it was shown that $\lambda(G) \leq \Delta^2 + \Delta$ by Chang and Kuo [7], $\lambda(G) \leq \Delta^2 + \Delta - 1$ by Král' and Škrekovski [8], and then $\lambda(G) \leq \Delta^2 + \Delta - 2$ by Goncalves [9]. Until now, this conjecture is still open. Nevertheless, it is still interesting to study the Δ^2 -conjecture, which has been confirmed for several classes of graphs, such as chordal graphs, outerplanar graphs, generalized Petersen graphs, Hamiltonian graphs with $\Delta \leq 3$, two families of Hamming graphs etc (see [10]). Havet *et al.* obtained a result implying that the Δ^2 -conjecture is true for graphs with sufficiently large Δ . Thus, we may need to study the $L(2,1)$ -labelling problem for graphs with small Δ . Motivated with this, the $L(2,1)$ -labelling problem for the brick product graphs was studied [10].

Let $\ell \geq 2$, $m \geq 1$ and $r \geq 0$ be integers such that $m+r$ is even. Let $C_{2\ell}$ be a cycle of length 2ℓ . The (m, r) -brick-product of $C_{2\ell}$, denoted by $Br(2\ell, m, r)$, is the graph with adjacency defined in two cases. For $m=1, r \geq 3$ must be odd and $Br(2\ell, 1, r)$ is obtained from the cycle $C_{2\ell} = (v_0, v_1, v_2, \dots, v_{2\ell-1}, v_0)$ by adding chords joining v_{2i} and v_{2i+r} for $i=0, 1, \dots, \ell-1$, where subscripts are taken modulo 2ℓ . In the general case where $m \geq 2$, $Br(2\ell, m, r)$ is obtained by first taking the vertex-disjoint union of m copies of $C_{2\ell}$, denoted by

$$C_{2\ell}(i) = (v_{i,0}, v_{i,1}, \dots, v_{i,2\ell-1}, v_{i,0}), i = 0, 1, \dots, m-1. \quad (1)$$

Next, for each pair $(i, j) \in \{0, 1, \dots, m-2\} \times \{0, 1, \dots, 2\ell-1\}$ such that i and j have the same parity, an edge is added to join $v_{i,j}$ and $v_{i+1,j}$. Finally, for odd $j=1, 3, \dots, 2\ell-1$, an edge is added to join $v_{0,j}$ and $v_{m-1,j+r}$, where the second subscript is modulo 2ℓ .

Li *et al.* [10] proposed the following conjecture:

Conjecture 1. [10] $\lambda(Br(2\ell, m, r)) = 5$ or 6 for all brick products $Br(2\ell, m, r)$ with $m \geq 2$ and $m+r \equiv 0 \pmod{2\ell}$

Shao *et al.* [11] confirmed the above conjecture, *i.e.* it was proved that

Theorem 1. [11] $\lambda(Br(2\ell, m, r)) \leq 6$ if 1) ℓ is even, or 2) $\ell \geq 5$ is odd and $0 \leq r \leq 8$.

Therefore, Conjecture 1 is still open for odd ℓ and $r > 8$.

In this paper, we show that $Br(2\ell, m, r) \leq 6$ for $\ell=9$ or 11 , which confirms Conjecture 6.1 stated in [X. Li, V. Mak-Hau, S. Zhou, The $L(2,1)$ -labelling problem for cubic Cayley graphs on dihedral groups, J. Comb. Optim. (2013) 25: 716-736] in the case when $\ell=9$ or 11 . Moreover, we show that $Br(2\ell, m, r) = 5$ if 1) either $\ell \equiv 0 \pmod{6}$, m is odd, $r=3, 2$ or $\ell \equiv 0 \pmod{3}$, m is even $\pmod{2}$, $r=0$.

2. Main Results

From the definition of the brick product graph, it is clear that

Fact 1. $Br(2\ell, m, r)$ is isomorphic to $Br(2\ell, m, 2\ell - r)$.

2.1. Some Results on the Upper Bound 6 of λ -Number

In [6], it was shown that

Lemma 1. [6] The λ -number of any connected cubic graph is at least 5.

Proposition 1. Let $\ell = 9$. Then $\lambda(Br(2\ell, m, r)) \leq 6$ for all $m \geq 3$.

By Theorem 1, we have $\lambda(Br(2\ell, m, r)) \leq 6$ for all $m \geq 3$ and $r \leq 8$. Together with Fact 1, we only need to consider $r = 9$. Let

$$P_3 = \begin{bmatrix} 1 & 3 & 2 \\ 4 & 0 & 4 \\ 2 & 6 & 6 \\ 0 & 4 & 0 \\ 6 & 1 & 2 \\ 4 & 3 & 5 \\ 2 & 0 & 0 \\ 6 & 6 & 4 \\ 1 & 3 & 2 \\ 5 & 5 & 0 \\ 0 & 2 & 6 \\ 3 & 4 & 1 \\ 1 & 6 & 3 \\ 4 & 2 & 5 \\ 6 & 0 & 0 \\ 2 & 5 & 2 \\ 4 & 1 & 4 \\ 6 & 6 & 0 \end{bmatrix}, P_5 = \begin{bmatrix} 4 & 6 & 4 & 6 & 2 \\ 2 & 2 & 0 & 3 & 5 \\ 0 & 4 & 5 & 1 & 0 \\ 6 & 6 & 2 & 6 & 2 \\ 4 & 1 & 0 & 4 & 5 \\ 2 & 5 & 3 & 2 & 0 \\ 6 & 0 & 1 & 6 & 6 \\ 3 & 3 & 5 & 4 & 2 \\ 5 & 1 & 2 & 0 & 5 \\ 0 & 6 & 4 & 3 & 1 \\ 4 & 2 & 1 & 5 & 6 \\ 6 & 0 & 6 & 0 & 4 \\ 1 & 5 & 4 & 2 & 1 \\ 3 & 3 & 1 & 5 & 3 \\ 0 & 6 & 6 & 0 & 0 \\ 4 & 1 & 3 & 4 & 6 \\ 2 & 5 & 5 & 2 & 1 \\ 0 & 3 & 1 & 0 & 4 \end{bmatrix}, P_7 = \begin{bmatrix} 2 & 4 & 2 & 4 & 3 & 1 & 0 \\ 0 & 6 & 0 & 6 & 0 & 6 & 2 \\ 5 & 2 & 5 & 2 & 5 & 3 & 4 \\ 3 & 4 & 1 & 4 & 1 & 0 & 6 \\ 1 & 6 & 3 & 6 & 6 & 2 & 3 \\ 5 & 2 & 5 & 2 & 0 & 4 & 0 \\ 0 & 4 & 0 & 4 & 5 & 1 & 5 \\ 6 & 6 & 3 & 6 & 3 & 6 & 3 \\ 2 & 0 & 5 & 2 & 1 & 4 & 1 \\ 5 & 4 & 1 & 0 & 6 & 2 & 5 \\ 3 & 6 & 6 & 3 & 3 & 0 & 3 \\ 0 & 1 & 4 & 1 & 5 & 4 & 1 \\ 6 & 3 & 0 & 6 & 0 & 2 & 6 \\ 1 & 5 & 2 & 2 & 4 & 5 & 0 \\ 4 & 0 & 6 & 0 & 6 & 3 & 2 \\ 2 & 2 & 4 & 3 & 1 & 0 & 4 \\ 0 & 5 & 0 & 5 & 4 & 2 & 1 \\ 6 & 1 & 6 & 1 & 6 & 5 & 3 \end{bmatrix}.$$

We use the pattern P_m to label $Br(18, m, 9)$ for $m \in \{3, 5, 7\}$, and P_m induces a 6- $L(2, 1)$ -labeling of $Br(18, m, 9)$. Therefore, the case $m < 9$ is settled.

$$Q_9 = \begin{bmatrix} 1 & 6 & 4 & 6 & 0 & 2 & 6 & 2 & 1 \\ 5 & 3 & 1 & 3 & 5 & 4 & 1 & 0 & 3 \\ 2 & 0 & 5 & 0 & 1 & 6 & 3 & 6 & 6 \\ 4 & 6 & 2 & 6 & 3 & 2 & 0 & 1 & 4 \\ 1 & 3 & 4 & 1 & 0 & 4 & 5 & 3 & 2 \\ 6 & 0 & 6 & 3 & 6 & 6 & 1 & 0 & 5 \\ 4 & 2 & 1 & 5 & 4 & 2 & 4 & 2 & 3 \\ 0 & 5 & 3 & 2 & 0 & 5 & 0 & 5 & 0 \\ 3 & 1 & 6 & 4 & 6 & 1 & 6 & 3 & 2 \\ 5 & 4 & 2 & 1 & 3 & 4 & 2 & 1 & 6 \\ 0 & 6 & 0 & 6 & 0 & 6 & 0 & 4 & 3 \\ 2 & 1 & 5 & 4 & 2 & 3 & 5 & 2 & 0 \\ 5 & 3 & 3 & 1 & 5 & 1 & 1 & 6 & 6 \\ 0 & 0 & 6 & 6 & 0 & 6 & 4 & 4 & 2 \\ 4 & 2 & 4 & 2 & 4 & 2 & 2 & 0 & 0 \\ 1 & 5 & 1 & 5 & 1 & 0 & 6 & 6 & 4 \\ 6 & 3 & 6 & 0 & 6 & 3 & 3 & 1 & 2 \\ 4 & 0 & 2 & 2 & 4 & 5 & 0 & 4 & 6 \end{bmatrix}, Q_{11} = \begin{bmatrix} 6 & 1 & 4 & 6 & 0 & 6 & 6 & 4 & 5 & 1 & 2 \\ 4 & 5 & 2 & 1 & 4 & 3 & 1 & 1 & 3 & 6 & 0 \\ 0 & 3 & 0 & 3 & 6 & 0 & 4 & 6 & 0 & 2 & 5 \\ 2 & 1 & 4 & 5 & 2 & 5 & 2 & 2 & 5 & 4 & 1 \\ 4 & 6 & 6 & 1 & 4 & 1 & 6 & 4 & 1 & 6 & 3 \\ 0 & 3 & 0 & 3 & 6 & 3 & 0 & 0 & 3 & 2 & 5 \\ 5 & 1 & 2 & 5 & 0 & 5 & 5 & 2 & 5 & 0 & 0 \\ 3 & 6 & 4 & 1 & 3 & 1 & 3 & 4 & 1 & 4 & 6 \\ 0 & 2 & 0 & 6 & 6 & 4 & 6 & 0 & 6 & 2 & 3 \\ 4 & 5 & 3 & 2 & 0 & 0 & 2 & 5 & 3 & 0 & 5 \\ 6 & 0 & 1 & 5 & 3 & 5 & 4 & 1 & 1 & 6 & 2 \\ 2 & 3 & 6 & 0 & 6 & 1 & 6 & 6 & 4 & 3 & 0 \\ 4 & 1 & 2 & 4 & 2 & 4 & 3 & 0 & 0 & 5 & 6 \\ 0 & 6 & 0 & 6 & 0 & 0 & 5 & 4 & 2 & 1 & 4 \\ 5 & 3 & 5 & 3 & 4 & 2 & 1 & 6 & 5 & 3 & 2 \\ 2 & 0 & 2 & 0 & 6 & 6 & 3 & 3 & 1 & 0 & 5 \\ 4 & 6 & 6 & 4 & 3 & 1 & 0 & 5 & 6 & 2 & 1 \\ 0 & 3 & 0 & 2 & 5 & 4 & 2 & 2 & 0 & 4 & 6 \end{bmatrix}.$$

Now, we consider the case $m \geq 9$. If $m = 4k + 5$ for $k \geq 1$, we obtain a 6- $L(2,1)$ -labeling of $Br(18, m, 9)$ by repeating the leftmost four columns of Q_9 ; If $m = 4k + 7$ for $k \geq 1$, we obtain a 6- $L(2,1)$ -labeling of $Br(18, m, 9)$ by repeating the leftmost four columns of Q_{11} (see **Figure 1**). Therefore, $\lambda(Br(2\ell, m, r)) \leq 6$ for $\ell = 9$ and $m \geq 3$.

Proposition 2. Let $\ell = 11$. Then $\lambda(Br(2\ell, m, r)) \leq 6$ for all $m \geq 3$.

Similar to Proposition 1, we only need to consider the case $r = 9$ and 11.

Case 1: $r = 9$.

We use the following pattern P_m to label $Br(22, m, 9)$ for $m \in \{3, 5\}$, and P_m induces a 6- $L(2,1)$ -labeling of $Br(22, m, 9)$. Therefore, the case $m \leq 5$ is settled. Now, we consider the case $m \geq 7$. If $m = 4k + 3$ for $k \geq 1$, we obtain a 6- $L(2,1)$ -labeling of $Br(22, m, 9)$ by repeating the leftmost four columns of Q_7 ; If $m = 4k + 5$ for $k \geq 1$, we obtain a 6- $L(2,1)$ -labeling of $Br(22, m, 9)$ by repeating the leftmost four columns of Q_9 . Therefore, $\lambda(Br(2\ell, m, r)) \leq 6$ for $\ell = 11$ and $m \geq 3$.

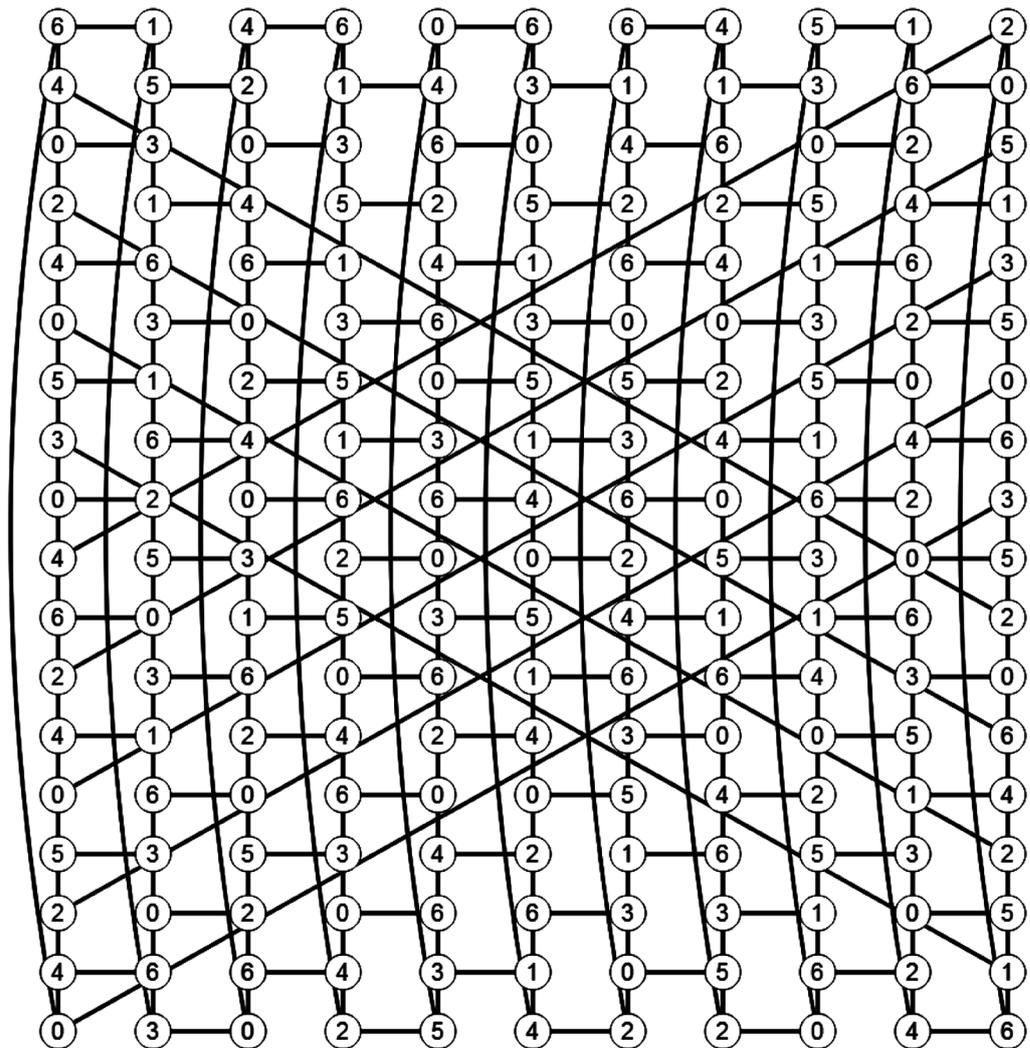

Figure 1. The 6- $L(2,1)$ -labeling of $Br(18, 11, 9)$ induced by Q_{11} .

Q'_9 = \begin{array}{c}
\begin{bmatrix} 5 & 3 & 4 & 1 \\ 0 & 6 & 0 & 3 \\ 4 & 2 & 2 & 5 \\ 6 & 0 & 4 & 0 \\ 3 & 5 & 6 & 2 \\ 0 & 1 & 3 & 4 \\ 2 & 4 & 5 & 1 \\ 5 & 6 & 0 & 3 \\ 1 & 3 & 4 & 6 \\ 4 & 5 & 1 & 0 \\ 2 & 0 & 6 & 3 \\ 5 & 4 & 2 & 1 \\ 0 & 6 & 0 & 4 \\ 3 & 2 & 5 & 6 \\ 1 & 4 & 3 & 1 \\ 6 & 6 & 0 & 4 \\ 0 & 2 & 5 & 2 \\ 4 & 4 & 1 & 6 \\ 1 & 6 & 3 & 0 \\ 5 & 2 & 5 & 2 \\ 0 & 4 & 0 & 4 \\ 2 & 1 & 6 & 6 \end{bmatrix} \\
\begin{bmatrix} 4 & 2 & 1 & 6 & 3 \\ 6 & 0 & 4 & 4 & 1 \\ 1 & 5 & 2 & 0 & 5 \\ 3 & 3 & 6 & 6 & 2 \\ 5 & 1 & 4 & 1 & 4 \\ 0 & 6 & 0 & 3 & 0 \\ 2 & 4 & 2 & 5 & 2 \\ 5 & 0 & 6 & 0 & 6 \\ 1 & 3 & 1 & 3 & 3 \\ 4 & 6 & 4 & 6 & 0 \\ 2 & 0 & 0 & 2 & 4 \\ 6 & 3 & 6 & 5 & 1 \\ 4 & 1 & 4 & 0 & 6 \\ 0 & 6 & 2 & 2 & 4 \\ 2 & 4 & 0 & 6 & 0 \\ 6 & 1 & 3 & 4 & 2 \\ 0 & 5 & 6 & 0 & 6 \\ 4 & 2 & 4 & 2 & 4 \\ 1 & 6 & 0 & 6 & 0 \\ 5 & 4 & 2 & 1 & 3 \\ 3 & 1 & 6 & 4 & 6 \\ 0 & 5 & 3 & 2 & 0 \end{bmatrix}
\end{array}
\end{array}$$

Case 2: $r = 11$.

We use the following pattern P'_m to label $Br(22, m, 11)$ for $m \in \{3, 5\}$, and P'_m induces a 6- $L(2, 1)$ -labeling of $Br(22, m, 11)$. Therefore, the case $m \leq 5$ is settled. Now, we consider the case $m \geq 7$. If $m = 4k + 3$ for $k \geq 1$, we obtain a

6- $L(2,1)$ -labeling of $Br(22, m, 11)$ by repeating the leftmost four columns of Q'_7 ; If $m = 4k + 5$ for $k \geq 1$, we obtain a 6- $L(2,1)$ -labeling of $Br(22, m, 11)$ by repeating the leftmost four columns of Q'_7 . Therefore, $\lambda(Br(2\ell, m, r)) \leq 6$ for $\ell = 11$ and $m \geq 3$.

From Propositions 1 and 2, we have

Theorem 2. Let $m \geq 3$. Then we have $\lambda(Br(2\ell, m, r)) \leq 6$ for $\ell = 9$ or 11.

2.2. Brick Product Graphs with λ -Number 5

In [10], it was proved that

Theorem 3. Let $\ell, m \geq 2$ and $r \geq 0$ be integers such that $m + r \equiv 0 \pmod{2\ell}$. Then

$$5 \leq \lambda(Br(2\ell, m, r)) \leq 7.$$

Moreover, $\lambda(Br(2\ell, m, r)) = 5$ if and only if one of the following holds:

- 1) 3 divides ℓ and 6 divides m ;
- 2) 6 divides ℓ and 3 divides m .

Furthermore, if neither 1) nor 2) is satisfied, then $\lambda(Br(2\ell, m, r)) = 6$ provided that $m = 2$ (and ℓ is even or odd), or both ℓ and m are even.

However, Theorem 3 consider the condition that $m + r \equiv 0 \pmod{2\ell}$. There may exist other brick product graphs with λ -number 5 with the condition $m + r \not\equiv 0 \pmod{2\ell}$. We provide some brick product graphs $Br(2\ell, m, r)$ with λ -number 5 in the following:

Theorem 4. Let $\ell \equiv 0 \pmod{3}$, $m \equiv 0 \pmod{2}$ with $m \geq 4$, $r = 0$. Then $\lambda(Br(2\ell, m, r)) = 5$.

Let $m = 2k$, $P = \begin{bmatrix} 5 & 2 \\ 1 & 4 \\ 3 & 0 \end{bmatrix}$, $P_1 = P^k = \underbrace{PP \dots P}_{k \text{ times}}$ and $Q = \begin{bmatrix} P_1 \\ P_1 \\ \vdots \\ P_1 \end{bmatrix}$, where P_1 is

used for $\frac{2\ell}{3}$ times. Then Q induces a 5- $L(2,1)$ -labeling of $Br(2\ell, m, r)$, and so $\lambda(Br(2\ell, m, r)) \leq 5$.

Proposition 3. Let $\ell \equiv 0 \pmod{6}$, $m = 3$, $r = 3$. Then $\lambda(Br(2\ell, m, r)) = 5$.

Let $P = \begin{bmatrix} 2 & 0 & 5 \\ 5 & 4 & 2 \\ 3 & 1 & 0 \\ 0 & 5 & 3 \\ 4 & 2 & 1 \\ 1 & 0 & 4 \\ 5 & 3 & 2 \\ 2 & 1 & 5 \\ 0 & 4 & 3 \\ 3 & 2 & 0 \\ 1 & 5 & 4 \\ 4 & 3 & 1 \end{bmatrix}$, and $Q = \begin{bmatrix} P \\ P \\ \vdots \\ P \end{bmatrix}$, where P is used for $\frac{\ell}{3}$ times. Then Q

induces a 5-L(2,1)-labeling of $Br(2\ell, m, r)$, and so $\lambda(Br(2\ell, m, r)) \leq 5$.

Proposition 4. Let $\ell \equiv 0 \pmod{6}$, $m = 5$, $r = 3$. Then $\lambda(Br(2\ell, m, r)) = 5$.

$$\text{Let } P = \begin{bmatrix} 1 & 3 & 4 & 0 & 1 \\ 5 & 0 & 2 & 3 & 5 \\ 2 & 4 & 5 & 1 & 2 \\ 0 & 1 & 3 & 4 & 0 \\ 3 & 5 & 0 & 2 & 3 \\ 1 & 2 & 4 & 5 & 1 \\ 4 & 0 & 1 & 3 & 4 \\ 2 & 3 & 5 & 0 & 2 \\ 5 & 1 & 2 & 4 & 5 \\ 3 & 4 & 0 & 1 & 3 \\ 0 & 2 & 3 & 5 & 0 \\ 4 & 5 & 1 & 2 & 4 \end{bmatrix}, \text{ and } Q = \begin{bmatrix} P \\ P \\ \vdots \\ P \end{bmatrix}, \text{ where } P \text{ is used for } \frac{\ell}{3} \text{ times.}$$

Then Q induces a 5-L(2,1)-labeling of $Br(2\ell, m, r)$, and so $\lambda(Br(2\ell, m, r)) \leq 5$.

Proposition 5. Let $\ell \equiv 0 \pmod{6}$, $m = 7$, $r = 3$. Then $\lambda(Br(2\ell, m, r)) = 5$.

$$\text{Let } P = \begin{bmatrix} 1 & 5 & 4 & 2 & 1 & 5 & 4 \\ 4 & 3 & 1 & 0 & 4 & 3 & 1 \\ 2 & 0 & 5 & 3 & 2 & 0 & 5 \\ 5 & 4 & 2 & 1 & 5 & 4 & 2 \\ 3 & 1 & 0 & 4 & 3 & 1 & 0 \\ 0 & 5 & 3 & 2 & 0 & 5 & 3 \\ 4 & 2 & 1 & 5 & 4 & 2 & 1 \\ 1 & 0 & 4 & 3 & 1 & 0 & 4 \\ 5 & 3 & 2 & 0 & 5 & 3 & 2 \\ 2 & 1 & 5 & 4 & 2 & 1 & 5 \\ 0 & 4 & 3 & 1 & 0 & 4 & 3 \\ 3 & 2 & 0 & 5 & 3 & 2 & 0 \end{bmatrix}, \text{ and } Q = \begin{bmatrix} P \\ P \\ \vdots \\ P \end{bmatrix}, \text{ where } P \text{ is used for } \frac{\ell}{3}$$

times. Then Q induces a 5-L(2,1)-labeling of $Br(2\ell, m, r)$, and so $\lambda(Br(2\ell, m, r)) \leq 5$.

Proposition 6. Let $\ell \equiv 0 \pmod{6}$, $m = 9$, $r = 3$. Then $\lambda(Br(2\ell, m, r)) = 5$.

$$\text{Let } P = \begin{bmatrix} 1 & 5 & 4 & 2 & 1 & 5 & 4 & 2 & 3 \\ 4 & 3 & 1 & 0 & 4 & 3 & 1 & 2 & 0 \\ 2 & 0 & 5 & 3 & 2 & 0 & 5 & 4 & 3 \\ 5 & 4 & 2 & 1 & 5 & 4 & 2 & 1 & 5 \\ 3 & 1 & 0 & 4 & 3 & 1 & 0 & 3 & 2 \\ 0 & 5 & 3 & 2 & 0 & 5 & 3 & 0 & 4 \\ 4 & 2 & 1 & 5 & 4 & 2 & 1 & 2 & 1 \\ 1 & 0 & 4 & 3 & 1 & 0 & 4 & 5 & 3 \\ 5 & 3 & 2 & 0 & 5 & 3 & 2 & 1 & 0 \\ 2 & 1 & 5 & 4 & 2 & 1 & 5 & 4 & 2 \\ 0 & 4 & 3 & 1 & 0 & 4 & 3 & 0 & 5 \\ 3 & 2 & 0 & 5 & 3 & 2 & 0 & 3 & 1 \end{bmatrix}, \text{ and } Q = \begin{bmatrix} P \\ P \\ \vdots \\ P \end{bmatrix}, \text{ where } P \text{ is used for}$$

$\frac{\ell}{3}$ times. Then Q induces a 5- $L(2,1)$ -labeling of $Br(2\ell, m, r)$, and so $\lambda(Br(2\ell, m, r)) \leq 5$.

By observing the results of Propositions 3 - 6, we propose the following conjecture:

Conjecture 2. Let $\ell \equiv 0 \pmod{6}$, $m \equiv 1 \pmod{2}$, $r = 3$. Then $\lambda(Br(2\ell, m, r)) = 5$.
