

Special Issue on Photodynamic Therapy

Call for Papers

Photodynamic Therapy (PDT) is a new technique for the treatment of tumor diseases in modern medical treatment. This is a therapeutic technique that uses a specific red light to produce a reaction between photosensitizer and tumor tissue cells, leading to tumor cell necrosis. It is used clinically to treat a wide range of medical conditions, including wet age-related macular degeneration, psoriasis, and has shown some efficacy in anti-viral treatments.

In this special issue, we intend to invite front-line researchers and authors to submit original researches and review articles on exploring **Photodynamic Therapy**. Potential topics include, but are not limited to:

- Photosensitizer and photochemistry
- Singlet oxygen
- Photodynamic effects
- The principle of photodynamic therapy
- Clinical application of photodynamic therapy
- Current status and development of photodynamic therapy
- Advantages and side effects of photodynamic therapy

Authors should read over the journal's [For Authors](#) carefully before submission. Prospective authors should submit an electronic copy of their complete manuscript through the journal's [Paper Submission System](#).

Please kindly notice that the “**Special Issue**” under your manuscript title is supposed to be specified and the research field “**Special Issue – Photodynamic Therapy**” should be chosen during your submission.

According to the following timetable:

Submission Deadline	November 14th, 2017
Publication Date	January 2018
