

## Special Issue on Global Warming

### Call for Papers

Global warming is the rise in the average temperature of Earth's atmosphere and oceans since the late 19th century and its projected continuation. Since the early 20th century, Earth's mean surface temperature has increased by about 0.8 °C (1.4 °F), with about two-thirds of the increase occurring since 1980. Warming of the climate system is unequivocal, and scientists are more than 90% certain that it is primarily caused by increasing concentrations of greenhouse gases produced by human activities such as the burning of fossil fuels and deforestation. These findings are recognized by the national science academies of all major industrialized nations.

A March 2013 survey by Pew Research Center for the People & the Press found that 69% say there is solid evidence that the earth's average temperature has been getting warmer over the past few decades, up six points since November 2011 and 12 points since 2009. An October 2012 survey also found that since 2009 an increasing percentage of Americans think that global warming is not natural, reporting that 42% of Americans believed that global warming is mostly caused by human activity, such as burning fossil fuels, up from 38% in 2011 and 34% in 2010.

In this special issue, we intend to invite front-line researchers and authors to submit original research and review articles on exploring **Global Warming**.

Authors should read over the journal's [Author Guidelines](#) carefully before submission, Prospective authors should submit an electronic copy of their complete manuscript through the journal [Paper Submission System](#).

Please kindly notice that the "**Special Issue**" under your manuscript title is supposed to be specified and the re-search field "**Special Issue- Global Warming**" should be chosen during your submission.

According to the following timetable:

Manuscript Due	July 30th, 2013
Publication Date	September, 2013
