

## Special Issue on Seed Plants

### Call for Papers

The spermatophytes, which means "seed plants", are some of the most important organisms on Earth. Life on land as we know it is shaped largely by the activities of seed plants. Soils, forests, and food are three of the most apparent products of this group. Seed-producing plants are probably the most familiar plants to most people, unlike mosses, liverworts, horsetails, and most other seedless plants which are overlooked because of their size or inconspicuous appearance. Many seedplants are large or showy. Conifers are seed plants; they include pines, firs, yew, redwood, and many other large trees. The goal of this special issue is to provide a platform for scientists and academicians all over the world to promote, share, and discuss various new issues and developments in this area of **seed plants**.

In this special issue, we invite front-line researchers and authors to submit original research and review articles that explore **seed plants**. In this special issue, potential topics include, but are not limited to:

- Gymnosperms
- Angiosperm
- Types of seed plants
- Seeds types
- Function of the seed
- Seed breeding

Authors should read over the journal's [For Authors](#) carefully before submission. Prospective authors should submit an electronic copy of their complete manuscript through the journal's [Paper Submission System](#).

Please kindly specify the "**Special Issue**" under your manuscript title. The research field "**Special Issue - Seed Plants**" should be selected during your submission.

Special Issue timetable:

Submission Deadline	November 23rd, 2017
Publication Date	January 2018
