

## Special Issue on Research on Algae

### Call for Papers

The highly varied group of organisms we call "algae" includes terrestrial algae, snow algae, seaweeds, phytoplankton, and "pond scums". Algae are morphologically simple, chlorophyll-containing organisms that range from microscopic and unicellular to very large and multicellular. The algal body is relatively undifferentiated and there are no true roots or leaves. Algae are typically autotrophic, deriving their "food", or energy, from their surroundings in the form of sunlight. They play an important role in food chains and in maintaining the oxygen supply on our planet. The goal of this special issue is to provide a platform for scientists and academicians all over the world to promote, share, and discuss various new issues and developments in this area of **research on algae**.

In this special issue, we invite front-line researchers and authors to submit original research and review articles that explore **research on algae**. In this special issue, potential topics include, but are not limited to:

- Morphology of algae
- Physiology of algae
- Distribution of algae
- Growth and reproduction
- Application of algae
- The economic value

Authors should read over the journal's [For Authors](#) carefully before submission. Prospective authors should submit an electronic copy of their complete manuscript through the journal's [Paper Submission System](#).

Please kindly specify the "**Special Issue**" under your manuscript title. The research field "**Special Issue - Research on Algae**" should be selected during your submission.

Special Issue timetable:

Submission Deadline	January 24th, 2018
Publication Date	March 2018
