

## Special Issue on Carbon Dioxide Emissions Control

### Call for Papers

The greenhouse effect is a process by which thermal radiation from a planetary surface is absorbed by atmospheric greenhouse gases, and is re-radiated in all directions. Since part of this re-radiation is back towards the surface and the lower atmosphere, it results in an elevation of the average surface temperature above what it would be in the absence of the gases. The goal of this special issue is to provide a platform for scientists and academicians all over the world to promote, share, and discuss various new issues and developments in the area of **carbon dioxide emissions control**.

In this special issue, we invite front-line researchers and authors to submit original research and review articles that explore **carbon dioxide emissions control**. In this special issue, potential topics include, but are not limited to:

- Greenhouse effect
- Role in climate change
- Real greenhouses
- The sources of greenhouse gases
- Control of greenhouse gases
- Control of carbon dioxide
- Control of freon

Authors should read over the journal's [Authors' Guidelines](#) carefully before submission. Prospective authors should submit an electronic copy of their complete manuscript through the journal's [Paper Submission System](#).

Please kindly specify the “**Special Issue**” under your manuscript title. The research field “**Special Issue - Carbon Dioxide Emissions Control**” should be selected during your submission.

Special Issue timetable:

Submission Deadline	September 11th, 2015
Publication Date	November 2015
