#### Abstract

The crystal structure of potential active 4-benzoyl-1,5-diphenyl-1 H -pyrazole-3-carbonitrile ( $\mathrm{C}_{23} \mathrm{H}_{15} \mathrm{~N}_{3} \mathrm{O}$ ) (I) has been determined from single crystal X-ray diffraction data. Also IR, Uv-vis and NMR spectral data were determined. The title compound crystalizes in the monoclinic space group $P 21 / \mathrm{c}$, with $a=9.3167(2), b=20.6677(3), c=10.6143(3) \AA$, $\beta=112.665(3)^{\circ}, V=1886.00(8) \AA^{3}, D_{\text {calc }}=1.23 \mathrm{~g} \mathrm{~cm}^{-3}, Z=4$. In the structure, intermolecular $H$-bonds lead to the formation of a centrosymmetric dimmer of the molecule. Furthermore, the compound has a wide transmission window ( 300 to 1100 nm ) with a transparency of nearly $100 \%$ and the UV cut-off wavelength occurs at 242 nm .

Keywords: Pyrazole-3-Carbonitrile; 2,3-Furandione; Single Crystal Structure; X-Ray Diffraction; IR; NMR Spectra

## 1. Introduction

Pyrazole nucleus and its derivatives such as nitriles, amides or esters possess numerous chemical, biological, medicinal, and agricultural applications due to their versatile biological activities appearing as antimicrobial [1,2], antiviral [3,4], antibacterial [5], antitumor [6-8], anti-inflammatory [9,10], antihistaminic [11], pesticidal [12,13], antifungal [14], against rheumatoid arthritis [15], anticonvulsant [16], antidepressant [17], antipyretic [18], and commercially important dyestuffs [19] agents. Their excellent control activities on various plant diseases are studied, too [20,21]. Recently, reactions of cyclic oxalyl compounds have been reported to give substituted heterocyclic compounds [22-26]. The reaction of 4-benzoyl-5-phenylfuran-2,3-dione, obtained easily from dibenzoylmethane and oxalyl dichloride [22], with various phenyl hydrazones and phenylhydrazine leads to pyrazole carboxylic acids and pyridazinones [27-29]. Nitriles are widely used for transformation into amides, amines, esters, carboxylic acids etc. [30]. Hence they have been used as intermediates for the synthesis of fine chemicals such as agricultural chemicals, dyes and medicines [31]. Title compound was mainly synthesized from 4-benzoyl-1,5-diphenyl-1 H -pyrazole-3-carboxylic acid together withacid chloride and its amide derivatives (Scheme 1). Furthermore, a cold solution of the acid amide in a mixture of Dimethyl formamide (DMF) and Thionylchloride $\left(\mathrm{SOCl}_{2}\right)$ was stirred at $0^{\circ} \mathrm{C}-5^{\circ} \mathrm{C}$ for 2 hours to give the

[^0]nitrile product. In view of these wide ranges of biological and pharmaceutical importance [32], in the present study, we report the synthesis, spectroscopic and structural characterization and the X-ray diffraction (XRD) study of the title compound, too, as well as for the comparisons of the geometrical features with related compounds in the literature. The structure of the title compound confirms the molecular formula based on microanalysis, IR, Uv-vis and NMR spectra beside X-ray diffraction data.

## 2. Experimental

### 2.1. Synthesis of the Title Compound

The title compound was prepared by the reaction of 4-benzoyl-1,5-diphenyl-1 H -pyrazole-3-carboxylic acid amide with DMF and $\mathrm{SOCl}_{2}$ (Figure 1). A cold solution of the acid amide $(0.37 \mathrm{~g}, 1.0 \mathrm{mmol})$ in a mixture of DMF $(0.7 \mathrm{~mL})$ and $\mathrm{SOCl}_{2}(0.15 \mathrm{~mL})$ was stirred at $0^{\circ} \mathrm{C}-5^{\circ} \mathrm{C}$ for 2 h similarly given in [5], and the solution was left stirring overnight. Then the mixture was poured over crushed ice and the precipitate formed was filtered off, washed with water and recrystallized from methanol and dried on $\mathrm{P}_{2} \mathrm{O}_{5}$ M.p. $167^{\circ} \mathrm{C}$, yield $70 \%(0.245 \mathrm{~g})$. The authenticity of the compound has been established by microanalyses, UV, IR, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra.

### 2.2. Materials and Physical Measurements

The melting point was determined on an ElectrothermalModel 9200 apparatus and is uncorrected. The IR ab

Figure 1. Chemical structure and synthesis pathway of the title compound.
sorption spectrum (Figure 6) was obtained in the region of $400-4000 \mathrm{~cm}^{-1}$ with a resolution of $4 \mathrm{~cm}^{-1}$ as KBr pellet using a Jasco Plus Model 460 FT IR spectrometer. Microanalysis was performed with a Carlo Erba Elemental Analyzer, model 1108. UV-vis spectrum was recorded in the range of 200 nm to 1100 nm using a Lambda 35 Perkin-Elmer spectrophotometer for the optical transmission studies (Figure 5). The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR (Figure 7) spectra were determined on a Bruker Avance 400 model spectrometer at 400 MHz and 100 MHz , respectively. All materials were purchased from commercial companies (Merck, Sigma, Aldrich and Fluka) and used directly without further purification. Solvents were dried by refluxing with the appropriate drying agents and distilled before use.

### 2.3. X-Ray Crystallography

For the crystal structure determination, the single-crystal of the compound $\mathrm{C}_{23} \mathrm{H}_{15} \mathrm{~N}_{3} \mathrm{O}$ was used for data collection on a four-circle Rigaku R-AXIS RAPID-S diffractometer (equipped with a two-dimensional area IP detector). The graphite-mon-chromatized $\mathrm{Mo}_{\alpha}$ radiation ( $\lambda=$ $0.71073 \AA$ ) and oscillation scans technique with $\Delta \omega=5^{\circ}$ for one image were used for data collection. The lattice parameters were determined by the least-squares methods on the basis of all reflections with $F^{2}>2 \sigma\left(F^{2}\right)$. Integration of the intensities, correction for Lorentz and polarization effects and cell refinement was performed using CrystalClear software [33]. The structures were solved by direct methods using SHELXS-97 [34] and refined by a full-matrix least-squares procedure using the program SHELXL-97 [34]. H atoms were positioned geometrically and refined using a riding model, fixing the aromatic C-H distances at $0.93 \AA\left[\mathrm{U}_{\text {iso }}(\mathrm{H})=1.2 \mathrm{U}_{\text {eq }}(\mathrm{C})\right]$. The final difference Fourier maps showed no peaks of chemical significance. Molecular structure of the compound showing the atomic numbering scheme is shown in Figure 2. The crystallography details for the structures determination of the compound was presented in Table 1 Selected bond distances and bond angles are listed in Table 2.

## 3. Results and Discussion

Title compound crystallizes in the monoclinic centrosymmetric space group $P 21 / \mathrm{c}$ (no: 14) with $Z=4$. The structure of the compound consists of cyano, benzoyl and
two phenyl fragments that connected to the pyrazole ring. Due to the strong steric hindrance, phenyl moieties are considerably twisted according to the pyrazole plane. Dihedral angles between the phenyl planes 1-2, 1-3, 2-3 [C1/C6 (1), C7/C12 (2), C18/C23 (3)] are 39.18(8) ${ }^{\circ}$, $59.57(7)^{\circ}, 88.98(7)^{\circ}$, respectively. The N-C distances 1.330 and $1.362(3) \AA$ deviate significantly from the mean value of $\mathrm{N}-\mathrm{C}$ distances in pyrazole rings $1.357(12) \AA$ [35-37]. It has been reported [38] that the N-N bond length in the pyrazoline ring varies over a wide range, from $1.234(8)$ to $1.385(4) \AA$, where the length depends on the substituents bonded to the N atoms. Accordingly, the length of the adjacent $\mathrm{C}=\mathrm{N}$ bond ranges from 1.288(4) to $1.461(8) \AA$. These differences are caused by a varying degree of conjugation in the $\pi$-electron portion of the pyrazoline ring, which is sensitive to the nature of the substituent(s) bonded to the atoms of the $\pi$ system. The N2-N3 bond length of $1.358(3) \AA$ found in the title compound further extends this range, approximating the length of a pure single bond $1.41 \AA$ [39].

In the structure, benzoyl groups are joined by two C $\mathrm{H} \cdots \mathrm{O}\left[\mathrm{C}(12) \cdots \mathrm{O}(1)^{\mathrm{a}}=3.157(3) \AA, \mathrm{C}(12)-\mathrm{H} \cdots \mathrm{O}(1)^{\mathrm{a}}=\right.$ $119^{\circ}$, symmetry code (a); $\left.2-\mathrm{x},-\mathrm{y}, 1-\mathrm{z}\right] H$ bonds, which lead to the formation of a centrosymmetric dimer of the molecule in the crystal unit cell (Figure 3). The title compound also contains intermolecular C-H... $\pi$ interaction. Atom $\mathrm{C}(22)$ in the molecule at ( $\mathrm{x}, \mathrm{y}, \mathrm{z}$ ) acts as hydrogen-bond donor to the $\mathrm{C} 7 / \mathrm{C} 12$ phenyl ring in the molecule at $(-1+x, y,-1+z)$, so forming a chain running parallel to the [100] direction.

Figure 2. Molecular structure of the compound showing the atomic numbering system. Displacement ellipsoids are drawn at the $\mathbf{3 0 \%}$ probability level.

Elemental analysis of compound for carbon, hydrogen, and nitrogen are in good agreement with theoretical values. The theoretical and observed element percentages respectively are: $\% \mathrm{C}: 79.07$ and $78.94, \% \mathrm{H}: 4.33$ and $4.45, \% \mathrm{~N}: 12.03$ and 12.18 .

Optical transmission spectrum of the compound is shown in Figure 5. The range of optical transmittance
and the transparency cut-off are important parameters for a single crystal used in optical applications. It has a wide transmission window ( 300 to 1100 nm ) with a transparency of nearly $100 \%$ and the UV cut-off wavelength occurs at 242 nm . The wide transmission range in the entire visible region is a useful property for opto-electronic applications. Hence, the title compound has become a

Figure 3. Part of the crystal structure of the molecule, showing the formation of a centrosymmetric dimer. Atoms marked with an (a) are at the symmetry position ( $2-\mathrm{x},-\mathrm{y}, 1-\mathrm{z}$ ).

Figure 4. Packing diagram and $H$ bonding geometry along the $a$-axis [symmetry code (a): $2-\mathrm{x},-\mathbf{y}, 1-\mathrm{z}$ ].
good candidate for optoelectronic applications.
The FT IR spectrum (Figure 6) of the title compound show sharp absorption bands occurred in the range $3095-3000 \mathrm{~cm}^{-1}$ due to the aromatic (C-H) stretching vibrations. The sharp and middle-intensity IR absorption band of the nitrile ( $-\mathrm{C}=\mathrm{N}$ ) group founds at $2246 \mathrm{~cm}^{-1}$. Weak combination or overtone bands appear in the $2000-1670 \mathrm{~cm}^{-1}$ region. The strong characteristic absorption band at $1652 \mathrm{~cm}^{-1}$ indicate the $\mathrm{C}=\mathrm{O}$ (benzoyl) group of the compound [40].

The sharp skeleton bands observed at 1614 (w), 1597 (m), 1578 (w), 1536 (w), 1498 (m), 1482 (s), 1461 (s) $\mathrm{cm}^{-1}$ characterize the $\mathrm{C} \cdots \mathrm{C}$ and $\mathrm{C} \cdots \mathrm{N}$ vibrations of phenyl and pyrazole rings. The additional absorption bands at
$980(\mathrm{~m}), 937$ (m), 913 (s), 850 (w) $\mathrm{cm}^{-1}$ are due to the aromatic ( $\mathrm{C}-\mathrm{H}$ ) in-plane bending vibrations. Moreover, the strong absorption bands occurred at 765 (m), 742 (s), 696 (s), 665 (m) cm ${ }^{-1}$ belong to the ${ }^{-} \mathrm{C}-\mathrm{H}$ bond out of plane bending and $\mathrm{C} \cdots \mathrm{C}$ bond bending vibrations of the substituted pyrazole and phenyl rings, respectively.

The structure of the title compound was further characterized by NMR absorption. Important structural information about can be obtained from its NMR spectra. In the ${ }^{13} \mathrm{C}$-NMR spectrum (Figure 7) of the $\mathrm{CDCl}_{3}$ solution of the compound was observed $=188.24(\mathrm{t}, J=4.5$ $\mathrm{Hz}, \mathrm{Ph}-\mathrm{C}=\mathrm{O}$ ), 145.21 ( $\mathrm{s}, \mathrm{C}-3$ ), and $138.26 \mathrm{ppm}(\mathrm{t}, J=$ $4.6 \mathrm{~Hz}, \mathrm{C}-5)$. The peaks at $136.75,133.48,130.23$, $129.78,129.64,129.23,129.16,128.92,128.54,128.32$,

Figure 5. Optical transmission spectrum of the title compound.

Figure 6. FT-IR spectrum for the title compound in KBr pellet.

Figure 7. A part of ${ }^{13} \mathrm{C}$-NMR spectrum of the title compound.
$127.02,126.79,125.46,124.77 \mathrm{ppm}(\mathrm{s}, \mathrm{C}-4)$ are thought to represent the aromatic carbons and a singlet peak at 112.37 ppm represent the nitrile group [40].

Therefore, final confirmation of the structure of the compound was derived from its ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum: $=7.72-7.09 \mathrm{ppm}$ a set of signals for aromatic protons.

## 4. Conclusion

Consequently, the novel compound is a significant preliminary compound due to the fact that original pyra-zole-3-carboxylic acid derivative includes nitrile group in its structure. It is air-stable in the solid state, crystallized from methyl alcohol and insoluble in water. Additionally, it has good solubility in common organic solvents, such as $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, THF, DMF, DMSO, $\mathrm{CHCl}_{3}$, acetone and toluene. The authenticity of the compound has been established by UV, IR, NMR, XRD and elemental analysis techniques. The title compound characterized can be essential in medicinal and biological applications. Some pyrazole derivatives, as known, have been used to treat some diseases [1-21,30-32]. The title structure may be
important from a medicinal point of view as well as their widespread biological significance. Further investigation on the mechanism, potential activity and the optimal reaction condition is currently in progress.
