Software design is just like music composition, but more strict on logic and grammar checking. The checking procedure is called software testing.

Software testing is an investigation conducted to provide stakeholders with information about the quality of the product or service under test. Software testing can also provide an objective, independent view of the software to allow the business to appreciate and understand the risks of software implementation. Test techniques include, but are not limited to, the process of executing a program or application with the intent of finding software bugs.

Software testing plays a very important part on software development. The usability of any software depends on it. There are many testing methods which can be applied during software testing. Improvements have always been made with the evolution of software engineering.

This special issue will mainly focus on solving software testing issues and the latest research approaches.

Authors should read over the journal’s Author Guidelines carefully before submission, Prospective authors should submit an electronic copy of their complete manuscript through the journal Paper Submission System.

Please kindly notice that the “Special Issue” under your manuscript title is supposed to be specified and the re-search field “Special Issue- Software Testing” should be chosen during your submission.

According to the following timetable:
