Special Issue on
Properties, Composition, and Production of Metal Alloys

Call for Papers

An alloy is a substance made by melting two or more elements together, at least one of them a metal. An alloy crystallizes upon cooling into a solid solution, mixture, or intermetallic compound. The components of alloys cannot be separated using a physical means. An alloy is homogeneous and retains the properties of a metal, even though it may include metalloids or nonmetals in its composition. The goal of this special issue is to provide a platform for scientists and academicians all over the world to promote, share, and discuss various new issues and developments in the area of properties, composition, and production of metal alloys.

In this special issue, we intend to invite front-line researchers and authors to submit original research and review articles on exploring properties, composition, and production of metal alloys. Potential topics include, but are not limited to:

- Properties of metal alloys
- Steel and pig iron
- Heat-treatable alloys
- Substitutional and interstitial alloys
- Precious-metal alloys
- Applications of metal alloys

Authors should read over the journal’s For Authors carefully before submission. Prospective authors should submit an electronic copy of their complete manuscript through the journal’s Paper Submission System.

Please kindly specify the “Special Issue” under your manuscript title. The research field “Special Issue - Properties, Composition, and Production of Metal Alloys” should be selected during your submission.

Special Issue Timetable:

<table>
<thead>
<tr>
<th>Submission Deadline</th>
<th>January 29th, 2019</th>
</tr>
</thead>
<tbody>
<tr>
<td>Publication Date</td>
<td>March 2019</td>
</tr>
</tbody>
