Special Issue on Arthroplasty Research

Call for Papers

Arthroplasty is a surgical procedure that restores stiff, ankylosis or deformed joints to a painless, active and functional state. There are two types of arthroplastic surgery: joint resection and interpositional reconstruction. Joint resection involves removing a portion of the bone from a stiffened joint, creating a gap between the bone and the socket to improve the range of motion. Interpositional reconstruction is procedure to reshape the joint and add a prosthetic disk between the two bones forming the joint. Arthroplasty is an elective procedure that is done to reduce the damage caused by arthritis or other types of trauma.

In this special issue, we intend to invite front-line researchers and authors to submit original researches and review articles on exploring arthroplasty research. Potential topics include, but are not limited to:

- Surgical therapies for osteoarthritis
- Implant arthroplasty
- Joint replacement surgery
- Resection arthroplasty
- Resurfacing arthroplasty
- Osteotomy
- Joint dislocation
- Ligament reconstruction
- Complications after surgery
- Prosthetic joint infections

Authors should read over the journal’s For Authors carefully before submission. Prospective authors should submit an electronic copy of their complete manuscript through the journal’s Paper Submission System.

Please kindly notice that the “Special Issue” under your manuscript title is supposed to be specified and the research field “Special Issue – Arthroplasty Research” should be chosen during your submission.

According to the following timetable:
