## Abstract

Recent studies on the flora of paramos in Costa Rica, reveal two new endemic taxa described here as *Gaultheria paramicola* A. Rojas and *Vaccinium reptans* A. Rojas, both known only from Costa Rica and Panama. The first new species have been confused with *Pernettya prostrata* (Cav.) DC. (=*Gaultheria myrsinoides* Kunth), however due to its mucronate leaves without visible secondary veins and white to red fruits it is more related to *G. mucronata* (L. f.) Hook. & Arn., a species only known from Chile and Argentina but differs because it is hermaphrodite (vs. monoecious), relative shorter plants, shorter laminar blade, shorter corolla, smaller fruits, higher altitudinal distribution and different geographical distribution. The second new species has been confused with *Vaccinium consanguineum* Klotzsch and *V. floribundum* Kunth but differs from both because it has procumbent (vs. erect) habit, ovate (vs. lanceolate) leaves, pruinose (vs. not or few pruinose), and insipid (vs. bittersweet) fruits with suberect (vs. appressed) calyx (except in *V. floribundum*).

## Subject Areas

Plant Science

## Keywords

Magnoliidae, Novelties, Paramos, *Gaultheria mucronata* (L. f.) Hook. & Arn., *Vaccinium consanguineum* Klotzsch, *Vaccinium floribundum* Kunth

## 1. Introduction

Slaumer [1] in his revision of the genus *Pernettya* divides the genus into two sec-

tions *Archiper nettya* Sleumer and *Pseudogaultheria* Sleumer, the first comprises three series *Pumilae* Sleumer, *Purpureae* Sleumer and *Mucronatae* Sleumer, with *P. prostrata* and related species in the second series and *P. mucronata* in the third series.

Luteyn & Wilbur [2], use the genus *Pernettya* different from *Gaultheria* because it has truly berry fruits, with basal calyx and not acrid (versus capsular fruits in *Gaultheria* but enveloped by the fleshy calyx). Middleton & Wilcock [3], Powell & Kron [4] and Teillier & Escobar [5] include *Pernettya* as part of *Gaultheria* L., based on phylogenetic analysis.

The blueberry tribe (Vaccinieae) is a large and morphologically diverse group that is widespread in the temperate and tropical zones of most continents. The greatest species diversity is in the tropics, where Vaccinieae are a major component of montane cloud forests [6].

The synopsis of *Vaccinium* presented by Wilbur & Luteyn [7] includes 27 species from Mexico and Central America, which gives some indication of the rich yield resulting from the more intensive fieldwork that has taken place within the region in the past seven decades. More than half of the Mexican and Central American species of *Vaccinium* have been described in the most recent three decades, while only four species (or about 15%) were named in the first seventy-five years of the twentieth century and nine species (or 33 %) during the nineteenth century.

According to Kron *et al.* [6], *Vaccinium consanguineum* (Mesoamerican) forms a clade with *V. floribundum* (South American) and *V. meridionale* (Caribbean).

The purpose of this research is to describe two new species of berries discovered in the paramos of Costa Rica.

## 2. Materials and Methods

Recent studies in the vegetation of Costa Rican paramos made it possible to discover new taxa that will be published here and in other papers. The new species here considered are the result of comparisons with specimens of other neotropical species, and a review of related species and keys from the neotropical Ericaceae by Sleumer [1], Luteyn & Wilbur [4], Wilbur & Luteyn [7] and other papers that include *Gaultheria* (or *Pennettya*), *Vaccinium* and paramos vegetation as Teillier & Escobar [4], Bischeimer [8], González [9], Idárraga, Ortiz, Callejas & Merello [10], Luteyn [11], Vargas & Sánchez [12], Weberling & Furchheim [13]. The examined specimens are deposited in the CR, MO and USJ herbaria (acronyms following Thiers) [14]. To ensure the correct application names, original type material or digital type images were examined as available (Jstor Global Plants (<http://plants.jstor.org/>), and the new names were corroborated with International Plant Name Index (<http://www.ipni.org/ipni/plantnamesearchpage.do>)).

## 3. Results

Investigations in Costa Rican paramos made possible the discovering of two new

edible of edible berries described here.

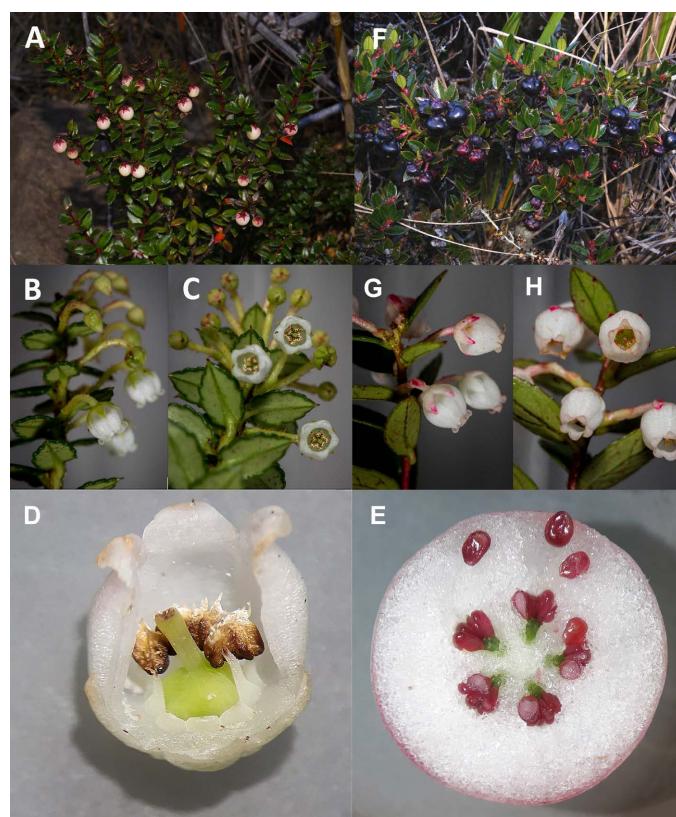

### 3.1. New Taxa

#### 3.1.1. *Gaultheria paramicola* A. Rojas, sp. nov.

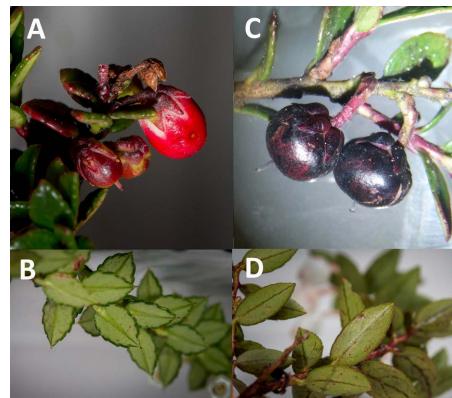

1) **Type.** COSTA RICA. San José: Dota, Copey, Cerro Las Vueltas, 9°37'40"N, 83°51'10"W, 3160 m, 3 Sept 2016, A. Rojas & P. Muñoz 10034 (Holotype: CR, Isotypes: K, MO, USJ).

2) **Diagnoses.** *Gaultheria paramicola* A. Rojas differs from *Gaultheria mucronata* (L. f.) Hook. & Arn. by hermaphrodite (vs. monoeious) and relative smaller (10 - 40 (-60) cm tall vs. (20-) 40 - 250 cm tall) plants, smaller (0.4 - 1.2 × 0.25 - 0.6 cm vs. 1 - 2 × 0.4 - 0.6 (-1) cm) blades, shorter (2 - 3.5 mm long vs. 5 - 6 mm long) corolla, shorter (3 - 6 mm broad × 4 - 6 (-7) mm long vs. 6 - 8 (-10) mm in diameter) fruits, and different altitudinal [(2400-) 3000 - 3800 m vs. 0 - 1050 (-2200 m) and geographical (Costa Rica and Panama vs. Bolivia, Argentina and Chile) distribution (see Figures 1-3, Table 1).

3) **Description.** Epilithic or terrestrial shrubs 10 - 40 (-60) cm tall, few branched, commonly stoloniferous. Branchlets few, terete, glabrous. Leaves 0.5 - 1.3 cm long, coriaceous, persistent; petiole 0.5 - 1.5 mm long; blades 0.4 - 1.2 × 0.25 - 0.6 cm,

**Figure 1.** *Gaultheria paramicola* A. Rojas. (A) Habit; (B) Flowers seen laterally; (C) Front view flowers; (D) Longitudinal section of flower showing stamens and pistil; (E) Cross section of fruit showing locules and seeds. *G. myrsinoides* Kunth; (F) Habit; (G) Flowers seen laterally; (H) Front view flowers. Photographs (A) and (F) taken by Armando Estrada Chavarría.

**Figure 2.** *Gaultheria paramicola* A. Rojas. (A) Branch with fruits; (B) Leaves seen abaxially. *G. myrsinoides* Kunth; (C) Branch with fruits; (D) Leaves seen abaxially.

**Figure 3.** (A) Mixed living plants of *Gaultheria paramicola* A. Rojas (at left) and *G. myrsinoides* Kunth. (at right). (B) (C) Comparative fruits of *G. paramicola* (at left) and *G. myrsinoides* (at right) [(B) lateral view and (C) top view of both taxa (*G. paramicola* at left and *G. myrsinoides* at right)]. Photograph (A) taken by Armando Estrada Chavarría.

ovate to broadly elliptic, with 4 - 5 incisions to each side of blade, dark green adaxially, pale green abaxially, glabrous in both surfaces, central vein prominent throughout its length ending in a mucron of 0.1 - 1 mm, secondary veins not visible. Flowers individual and grouped at apex of branches, 0.7 - 1.0 cm long; pedicels 4 - 7 mm long, hairy; calyx deeply split, lobes 1.5 - 2.5 mm long, yellow-green in flowers to red in fruits, glabrous, deltoid, acute at apex; corolla 2.0 - 3.5 mm long, 2.0 - 3.5 mm in diameter, urceolate, globose, gamopetalous, with apex as wide as the base, white, glabrous, the lobes recurved or revolute, deltoid, acute, ca. 1.0 - 1.5 mm long, glabrous; stamens 10, 1.5 - 3 mm long, included in two series, the internal series (five stamens) longer than the others five; filaments

**Table 1.** Comparison of morphological characteristics among three taxa of *Gaultheria*: *G. mucronata* (L. f.) Hook. & Arn., *G. paramicola* A. Rojas and *G. myrsinoides* Kunth.

Character	<i>G. mucronata</i>	<i>G. paramicola</i>	<i>G. myrsinoides</i>
Sexuality	monoecious	hermaphrodite	hermaphrodite
Plants tall	(20-) 40 - 250 cm	10 - 40 (-60) cm	10 - 400 cm
Blade size	1 - 2 × 0.4 - 0.6 (-1) cm	0.4 - 1.2 × 0.25 - 0.6 cm	(0.8-) 1.2 - 2 (-4) × 0.4 - 0.9 (-1.2) cm
Blade apex	mucronate	mucronate	obtuse to acute
Blade margin	with 4 - 5 incisions to each side of blade	mucronate with 4 - 5 incisions to each side of blade	with 6 - 9 (-11) incisions to each side of blade
main vein abaxially	highlighted throughout its length	highlighted throughout its length	highlighted only at base
Secondary veins	not evident	not evident	Conspicuous
Corolla size	5 - 6 mm long	2 - 3.5 mm long	5 - 6 (-7) mm
Corolla form	Urceolate to urceolate-cylindrical	urceolate	urceolate-cylindrical
Corolla apex	as wide as the base to narrower	as wide as the base	narrower than the base
Corolla color	white	white	white to pink
Fruits size	6 - 8 (-10) mm in diameter	3 - 6 mm broad × 4 - 6 (-7) mm long	6 - 1.6 mm in diameter
Fruits form	globose, contracted at apex	globose to elongated, rounded at apex	globose, contracted at apex
Fruits color	white to red	white to red	black
Altitudinal distribution	0 - 1050 (-2200) m	(2400-) 3000 - 3800 m	(900-) 2000 - 3900 (-4630) m
Geographical distribution	Bolivia, Argentina and Chile	Costa Rica and Panama	México, Guatemala, Honduras, Nicaragua, Costa Rica, Panama, Colombia, Venezuela, Ecuador, Peru, Bolivia and Argentina

1 - 2 mm long, white, puberulent; anthers ca. 1 mm long, brown with white patches, ciliate. Fruits 3 - 6 mm broad × 4 - 6 (-7) mm long, fleshy, globose to elongate with rounded apex and white to red color, 4 - 5 locular but without aerial space.

**4) Etymology.** The name of this variety makes references to its habitat in páramos (with shrub or herbaceous vegetation typical of the mountains peaks in Central and South America at more than 3000 meters high).

**5) Distribution.** Known only from Costa Rica and Panama at (2400-) 3000 - 3800 m elevation in páramo vegetation.

**6) Additional revised specimens.** COSTA RICA. **Cartago**: El Guarco, Reventazón Basin, La Chonta, 3 km S del Empalme, at right hand of Interamericana Sur, 9°42'33"N, 83°56'51"W, 2400 m, 4 July 2000, *B. Brak & M. Vroklage* 58 (CR, MO); about 5 km E of the highest point on the Interamerican Hwy. (W of Villa Mills), 9°33'N, 83°44'W, 3200 m, 13 Jan 1967, *W. Burger & G. Matta* 4367 (CR); summit of Cerro Sábila, near km 86, Rute 2, 3420 m, 25 May 1983, *A. Chaverri* 1326 (CR); Cordillera de Talamanca, Cerro de La Muerte, Interameri-

can Hwy, Rute 2, km 89, ca. 3000 m, 5 Aug 1987, *G. Crow* 6992 (CR); ibidem, 9°04'N, 83°45'W, 3150 m, 19 Oct 1989, *G. Crow & D. Rivera* 7398 (CR); Cerro de La Muerte, Pan-American Highway, 5 km above Millsville (about 8 km above Nivel), Cordillera de Talamanca, 3400 - 3500 m, July 1949, *R. Holm & H. Chiriquí: Ridge above Alto Pineda, 08°49'N, 82°32'W, 9000 - 10400 ft [2745 - 3170 m], 15 Apr 1979, B. Hammel et al. 7103 (MO).

**7) Comparative analysis.** The new species is different from *Gaultheria mucronata* by the characters mentioned in the diagnoses. Also is different from *G. myrsinoides* because has smaller (10 - 40 (-60) cm tall vs. 10 - 400 cm tall) plants, smaller (0.4 - 1.2 × 0.25 - 0.6 cm vs. (0.8-) 1.2 - 2 (-4) × 0.4 - 0.9 (-1.2) cm) blades with mucronate (vs. obtuse to acute) apex, with 4 - 5 incisions (vs. 6 - 9 (-11) incisions) to each side of blade, highlighted throughout its length (vs. highlighted only at base), main vein abaxially and not evident (vs. conspicuous) secondary veins, shorter (2 - 3.5 mm long vs. 5 - 6 (-7) mm long) corolla and with white (vs. pink) color, shorter (3 - 6 mm broad × 4 - 6 (-7) mm long vs. 6 - 8 (-10) mm in diameter) fruits with white to red (vs. black) color and they edible (vs. poisonous) (see **Figures 1-3, Table 1**).

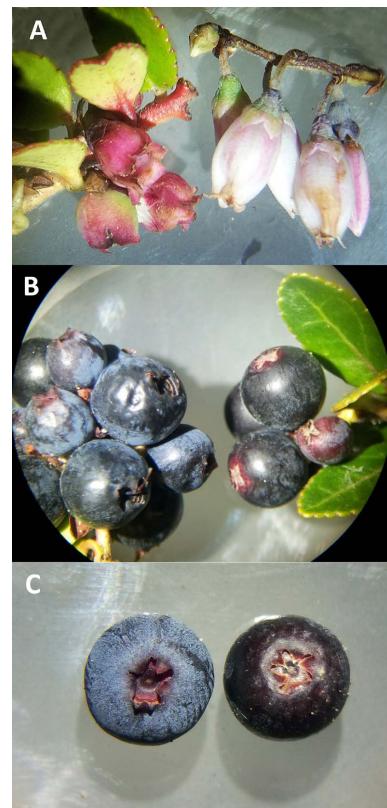

### 3.1.2. *Vaccinium reptans* A. Rojas, sp. nov.

**1) Type.** COSTA RICA. San José: Dota, Copey, Cerro Las Vueltas, 9°37'40"N, 83°51'10"W, 3160 m, 3 Sept 2016, A. Rojas & P. Muñoz 10035 (Holotype: CR; Isotypes: K, MO, USJ).

**2) Diagnoses.** *Vaccinium reptans* A. Rojas differs from *Vaccinium consanguineum* Klotzsch because has suffrutescent or decumbent (vs. erect) habit, 0.1 - 0.4 (-0.6) m (vs. (0.3-) 1 - 10 (-15) m) plant tall, arched to horizontal (vs. vertical or ascending) branches, ovate to broadly elliptic (vs. narrow to broadly elliptic or oblong) blades and they 0.6 - 1.3 × 0.3 - 0.8 cm (vs. (1-) 1.5 - 3 (-5.8) × 0.5 - 1.2 (-2.2) cm) with broadly cuneate to rounded (vs. acute to cuneate) base and broadly cuneate to rounded (vs. acute to obtuse) apex, elongate at base and globose at apex (vs. cylindrical) corolla and it 3 - 5 mm long (vs. 5 - 7.5 mm long) with pink (sometimes with red patches) (vs. white) color, black (vs. reddish to black) fruits with pruinose (vs. not or few pruinose) surface, insipid (vs. bittersweet) flavor, with suberect (vs. appressed) calyx and persistent (vs. deciduous) flower style (see **Figure 4** and **Figure 5, Table 2**).

**Figure 4.** *Vaccinium reptans* A. Rojas. (A) Upper view of habit; (B) Branch with flowers in lateral view; (C) Branch with flowers in down view; (D) Branch with mature fruits. *V. consanguineum* Klotzsch; (E) Lateral view of habit; (F) Branch with flowers; (G) Branch with mature fruits.

**Figure 5.** Comparative structures between *Vaccinium reptans* A. Rojas (at left in all pictures) and *V. consanguineum* Klotzsch (at right in all pictures). (A) Leaves. (B) Flowers. (C) and D. Fruits.

**Table 2.** Comparison of morphological characteristics among three species of *Vaccinium*: *V. consanguineum* Klotzsch, *V. floribundum* Kunth and *V. reptans* A. Rojas.

Character	<i>V. consanguineum</i>	<i>V. floribundum</i>	<i>V. reptans</i>
Plants tall	(0.3-) 1 - 10 (-15) m	0.2 - 1.2 (-2.5) m	0.1 - 0.4 (-0.6) m
Branches	vertical or ascending	ascending	arched to horizontal
Blade size	(1-) 1.5 - 3 (-5.8) × 0.5 - 1.2 (-2.2) cm	0.4 - 1.5 (-2.5) × 0.3 - 1.2 cm	0.6 - 1.3 × 0.3 - 0.8 cm
Blade form	narrow to broadly elliptic or oblong	elliptic to ovate-lanceolate	ovate to broadly elliptic
Blade base	acute to cuneate	acute to cuneate	broadly cuneate to rounded
Blade apex	acute to obtuse	acute to obtuse	obtuse to rounded
Corolla size	5 - 7.5 mm long	5 - 6.5 mm long	3 - 5 mm long
Corolla form	cylindrical	cylindrical	urceolate, elongate at base and globose at apex
Corolla color	white	white to pink	pink (sometime with red patches)
Fruits color	reddish to black	black	black
Fruits surface	not pruinose or few	pruinose or not	strongly pruinose
Remnant calyx in fruits	appressed	suberect	suberect
flower style persistent in fruit	no	commonly	commonly
fruit flavor	bittersweet	bittersweet	insipid
Geographical distribution	Mexico, Honduras, Costa Rica and Panama	Colombia, Venezuela, Ecuador, Peru, Bolivia and Argentina	Costa Rica and Panama

**3) Description.** Terrestrial or epilithic herb or shrub, suffrutescent or procumbent, 0.1 - 0.4 (-0.6) m tall. Leaves 0.7 - 1.5 cm long, 0.2 - 0.5 (-1) cm distant between the same side leaves, alternate; petiole 0.05 - 0.2 cm long, flattened in the adaxial surface, glabrous to shortly hairy; blades 0.6 - 1.3 × 0.3 - 0.8 cm, ovate to broadly elliptic, coriaceous, broadly cuneate to rounded at base, obtuse to rounded at apex, crenate-serrated at margin, dark green adaxially, pale green abaxially, glabrous to sparsely hairy in both surfaces, pinnately nerved. Inflorescences racemose with 6 - 10 flowers; flowers with pedicel 7 - 10 mm long; floral bracts 2, 1 - 2 mm long; calyx 1 - 1.5 mm long, with 4 - 5 lobes, broadly deltate, glabrous; corolla 3 - 5 mm long, urceolate, elongate at base and globose at apex, glabrous, pink (sometimes with red patches), with 4 - 5 lobes, they erect to recurved, deltoid, acute; stamens 8 or 10, 2 - 4 mm long; filaments 1.5 - 2.5 mm long. Fruits 5 - 8 mm in diameter, globose, black, strongly pruinose or glaucous, glabrous, with suberect remnant calyx and persistent style flower, 4 - 5 locular but with aerial space in each one.

**4) Etymology.** The name of its species makes references to decumbent habit.

**5) Distribution.** Known only from Costa Rica and Panama at (3000-) 3160 - 3750 m elevation in paramo vegetation.

**6) Additional revised specimens.** COSTA RICA. Cartago: "Cerro de La

Muerte” region, Cordillera de Talamanca, Cerro Sákira, 80 m N of summit, 3400 m, 28 Mar 1985, *S. Horn* 131 (CR); Cerro Sákira, Buenavista massif, 9°35'35"N, 83°45'38"W, 3417 m, 5 June 1993, *G. Vargas et al.* 1421 (CR); Buenavista massif, Sákira summit, 3417 m, 29 Aug 1969, *A. Weston* 6005 (CR, F). **Limón:** Cordillera de Talamanca, Atlantic slope, Kámuk massif, NE of the main Kámuk peak, 9°16' - 17'N, 83°00' - 02'W, 3000 - 3300 m, 17 - 18 Sep 1984, *G. Davidse & G. Herrera* 29302 (CR, MO); Cordillera de Talamanca, SW foot of Cerro Kámuk, 9°16'N, 83°02'30"W, 3200 - 3350 m, 24 Mar 1984, *G. Schneider* 239 (CR); Pérez Zeledón, Reserva Forestal Los Santos, Savegre basin, Cerro Buenavista, around the radio towers, 9°33'20"N, 83°45'30"W, 3400 m, 24 Abr 1998, *L. Vargas et al.* 59 (CR, MO).

**PANAMA. Bocas del Toro:** Cerro Fábrega and ridge to North, 14 km NE (straight line) of Estación Pittier, 9°06'52"N, 82°52'26"W, 3300 m, 3 Mar 2006, *A. Monro & S. Knapp* 5151 (BM, MO, PMA); S between Cerro Itamut and 'El Pyramide', 9°05'46"N, 82°52'25"W, 3200 m, 11 Mar 2006, *A. Monro & S. Knapp* 5296 (BM, MO, PMA); Cordillera de Talamanca, Cerro Echandi, on the international border, La Amistad International Park, 9°02'N, 82°49'W, 3050 - 3160 m, 22 Aug 1983, *G. Davidse et al.* 23856 (MO).

**7) Comparative analysis.** The new species is different from *Vaccinium consanguineum* Klotzsch by the characters mentioned in the diagnoses. Also is different from *V. floribundum* Kunth because has suffrutescent or decumbent (vs. erect) habit, 0.1 - 0.4 (-0.6) m (vs. 0.2 - 1.2 (-2.5) m) plant tall, arched to horizontal (vs. vertical or ascending) branches, ovate to broadly elliptic (vs. elliptic to ovate-lanceolate) blades with broadly cuneate to rounded (vs. acute to cuneate) base and broadly cuneate to rounded (vs. acute to obtuse) apex, elongate at base and globose at apex (vs. cylindrical) corolla and it 3 - 5 mm long (vs. 5 - 6.5 mm long) with pruinose (vs. not or few pruinose) surface and insipid (vs. bittersweet) flavor (see **Figure 4** and **Figure 5**, **Table 2**).

#### 4. Discussion

Weberling and Furchheim [13] mentioned to *Pernettya prostrata* (= *Gaultheria myrsinoides*) with size of plants between 10 and 30 cm tall and red fruits with a light apple flavor, however that characters correspond with *G. paramicola* here described. The same authors made referenced to *P. coriacea* with a size of 0.1 - 2 m tall and bluish and farinose fruits that correspond with *Gaultheria myrsinoides* a species mentioned by Rincón *et al.* [15] with the presence of poisonous fruits.

Luteyn [16] reports that *in the paramos of Costa Rica that P. prostrata have*

*populations with the apex of the leaves shortly mucronized and apparently with red berries (when ripe). These populations may represent a different species, but further study is required to determine this.* Undoubtedly the taxa mentioned is the same described here as *G. paramicola*.

Weberling and Furchheim [13] mentioned to *Vaccinium floribundum* growing horizontally on rocky ground and with aerial shoots that barely exceed 10 to 15 cm above the ground, two characters typical of *V. reptans* here described. Also Luteyn & Wilbur [2] inform to *V. floribundum* with *sufrutescent herb procumbent to a suberect shrub*, character same as the new species described here. However, the type specimens (Peru, Amazonas, Cajamarca, *Humboldt & Bonpland s.n.* (holotype: P-Bonpl!; Isotype: P!) shows erect and long branches with lanceolate blades (narrower than the new taxa and with acute apex), an entity that has white flowers with elongate corolla. Additionally, in Colombia and Ecuador several pictures have been uploaded to the internet with pink and broad corolla, but inclusive they have erected and long branches. After that, more studies are needed to resolve this complex group.

In different papers and books *Vaccinium floribundum* is mentioned from Costa Rica, but probably this species is restricted from South America; however, in Costa Rica two entities of tree or bush are present, one with globose tree top present in paramos or open areas between 2800 - 3550 m and it with close hypanthium which correspond with *V. consanguineum* and the other one with irregular tree top present in montane forest between (1600-) 2000 - 3100 m and it with open hypanthium at apex which probably correspond with *V. meridionale* Sw.

## 5. Conclusion

The main contribution of this research is the discovery of two new species for science of the Ericaceae family, which belong to the group of blueberries, they are edible for humans and probably same as other blueberries with high content of antioxidant chemical compounds. Use of fruits with antioxidant content in Ericaceae family [17], or other medical plants [18] joined with probiotics organisms [19] could be a great solution in food industry.

## Acknowledgments

This work was possible thanks to Universidad Nacional de Costa Rica (UNA) and Sistema Nacional de Áreas de Conservación (SINAC). Thanks also to Herbario Nacional de Costa Rica (CR) for providing specimen loans and the space for analyze the specimens. Thanks to Armando Estrada for the photographs, to the anonymous reviewers for their help; and to all who, in one way or another, made this work possible.

## Conflicts of Interest

The authors declare no conflicts of interest.
