## Abstract

The conjugate effects of radiation and joule heating on magnetohydrodynamic (MHD) free convection flow along a sphere with heat generation have been investigated in this paper. The governing equations are transformed into dimensionless non-similar equations by using set of suitable transformations and solved numerically by the finite difference method along with Newton's linearization approximation. Attention has been focused on the evaluation of shear stress in terms of local skin friction and rate of heat transfer in terms of local Nusselt number, velocity as well as temperature profiles. Numerical results have been shown graphically for some selected values of parameters set consisting of heat generation parameter  $Q$ , radiation parameter  $Rd$ , magnetic parameter  $M$ , joule heating parameter  $J$  and the Prandtl number  $Pr$ .

**Keywords:** Natural Convection, Thermal Radiation, Prandtl Number, Joule Heating, Heat Generation, Magnetohydrodynamics, Nusselt Number

## 1. Introduction

The conjugate effects of radiation and joule heating on magnetohydrodynamic (MHD) free convection boundary layer on various geometrical shapes such as vertical flat plate, cylinder, sphere etc, have been studied by many investigators and it has been a very popular research topic for many years. Nazar *et al.* [1], Huang and Chen [2] considered the free convection boundary layer on an isothermal sphere and on an isothermal horizontal circular cylinder both in a micropolar fluid. Molla *et al.* [3] have studied the problem of natural convection flow along a vertical wavy surface with uniform surface temperature in presence of heat generation or absorption. Miraj *et al.* [4] studied the effect of radiation on natural convection flow on a sphere in presence of heat generation. Amin [5] also analyzed the influences of both first and second order resistance, due to the solid matrix of non-darcy porous medium, Joule heating and viscous dissipation on forced convection flow from a horizontal circular cylinder under the action of transverse magnetic field.

Hossain [6] studied viscous and joule heating effects on magnetohydrodynamic (MHD) free convection flow with variable plate temperature. Alam *et al.* [7] studied the viscous dissipation effects with MHD natural convection flow on a sphere in presence of heat generation.

In the present work, the effects of joule heating with radiation heat loss on natural convection flow around a sphere have been investigated. The governing partial differential equations are reduced to locally non-similar partial differential forms by adopting appropriate transformations. The transformed boundary layer equations are solved numerically using implicit finite difference method with Keller box scheme described by Keller [8] and later by Cebeci and Bradshaw [9]. The results have been shown in terms of the velocity, temperature profiles, the skin friction and surface heat transfer

## 2. Formulation of the Problem

A steady two-dimensional magnetohydrodynamic (MHD) natural convection boundary layer flow from an isother-

mal sphere of radius  $a$ , which is immersed in a viscous and incompressible optically dense fluid with heat generation and radiation heat loss is considered. The physical configuration considered is as shown in **Figure 1**.

Under the above assumptions, the governing equations for steady two-dimensional laminar boundary layer flow problem under consideration can be written as

$$\frac{\partial}{\partial X}(rU) + \frac{\partial}{\partial Y}(rV) = 0 \tag{1}$$

$$U \frac{\partial U}{\partial X} + V \frac{\partial U}{\partial Y} = \nu \frac{\partial^2 U}{\partial Y^2} + g\beta(T - T_\infty) \sin\left(\frac{X}{a}\right) - \frac{\sigma_0 B_0^2}{\rho} U \tag{2}$$

$$U \frac{\partial T}{\partial X} + V \frac{\partial T}{\partial Y} = \frac{k}{\rho c_p} \left( \frac{\partial^2 T}{\partial Y^2} - \frac{1}{k} \frac{\partial q_r}{\partial Y} \right) + \frac{Q_0}{\rho c_p} (T - T_\infty) + \frac{\sigma_0 B_0^2}{\rho c_p} U^2 \tag{3}$$

With the boundary conditions

$$\begin{aligned} U = V = 0, \quad T = T_\infty \quad \text{at} \quad Y = 0 \\ U \rightarrow 0, \quad T \rightarrow T_\infty \quad \text{as} \quad Y \rightarrow \infty \end{aligned} \tag{4}$$

The above equations are further non-dimensionalised using the new variables:

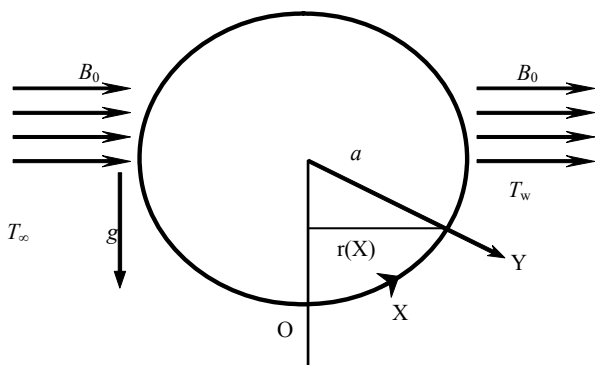

$$\xi = \frac{X}{a}, \quad \eta = \frac{Y}{a} Gr^{\frac{1}{4}}, \quad u = \frac{aU}{\nu} Gr^{-\frac{1}{2}}, \quad v = \frac{aV}{\nu} Gr^{-\frac{1}{4}} \tag{5}$$

$$\theta = \frac{T - T_\infty}{T_w - T_\infty}, \quad Gr = \frac{g\beta(T_w - T_\infty)a^3}{\nu^2} \tag{6}$$

$$\theta_w = \frac{T_w}{T_\infty}, \quad \Delta = \theta_w - 1 = \frac{T_w}{T_\infty} - 1 = \frac{T_w - T_\infty}{T_\infty} \tag{7}$$

The radiation heat flux is in the following form

$$q_r = -\frac{4\sigma}{3(\alpha_r + \sigma_s)} \frac{\partial T^4}{\partial Y} \tag{8}$$

**Figure 1. Physical model and coordinate system.**

Substituting (5), (6) and (7) into Equations (1), (2) and (3) leads to the following non-dimensional equations

$$\frac{\partial}{\partial \xi}(ru) + \frac{\partial}{\partial \eta}(rv) = 0 \tag{9}$$

$$u \frac{\partial u}{\partial \xi} + v \frac{\partial u}{\partial \eta} = \frac{\partial^2 u}{\partial \eta^2} + \theta \sin \xi - \frac{\sigma_0 B_0^2 a^2}{\rho \nu Gr^{\frac{1}{2}}} u \tag{10}$$

$$u \frac{\partial \theta}{\partial \xi} + v \frac{\partial \theta}{\partial \eta} = \frac{1}{Pr} \frac{\partial}{\partial \eta} \left[ \left\{ 1 + \frac{4}{3} Rd (1 + (\theta_w - 1)\theta)^3 \right\} \frac{\partial \theta}{\partial \eta} \right] + Q\theta + Ju^2 \tag{11}$$

where  $Pr = \nu c_p / k$  is the Prandtl number,

$Q = Q_0 a^2 / \mu C_p Gr^{\frac{1}{2}}$  is the heat generation parameter,  $Rd = 4\sigma T_\infty^3 / k(\alpha_r + \sigma_s)$  is the radiation parameter and  $J = \sigma_0 B_0^2 \nu / \rho C_p (T_w - T_\infty)$  is the joule heating parameter.

With the boundary conditions (4) become

$$\begin{aligned} u = v = 0, \quad \theta = 1 \quad \text{at} \quad \eta = 0 \\ u \rightarrow 0, \quad \theta \rightarrow 0 \quad \text{as} \quad \eta \rightarrow \infty \end{aligned} \tag{12}$$

To solve Equations (10) and (11) with the help of following variables

$$\psi = \xi r(\xi) f(\xi, \eta), \quad \theta = \theta(\xi, \eta), \quad r(\xi) = \sin \xi \tag{13}$$

where  $\psi$  is the stream function defined by

$$u = \frac{1}{r} \frac{\partial \psi}{\partial \eta}, \quad v = -\frac{1}{r} \frac{\partial \psi}{\partial \xi} \tag{14}$$

Equation (10) can be written as

$$\begin{aligned} \frac{\partial^3 f}{\partial \eta^3} + \left( 1 + \frac{1}{\sin \xi} \xi \cos \xi \right) f \frac{\partial^2 f}{\partial \eta^2} + \theta \frac{\sin \xi}{\xi} \\ - \left( \frac{\partial f}{\partial \eta} \right)^2 - M \frac{\partial f}{\partial \eta} = \xi \left( \frac{\partial f}{\partial \eta} \frac{\partial^2 f}{\partial \xi \partial \eta} - \xi \frac{\partial f}{\partial \xi} \frac{\partial^2 f}{\partial \eta^2} \right) \end{aligned} \tag{15}$$

where  $M = \sigma_0 B_0^2 a^2 / \mu Gr^{\frac{1}{2}}$  is the MHD parameter.

Equation (11) becomes

$$\begin{aligned} \frac{1}{Pr} \frac{\partial}{\partial \eta} \left\{ \left( 1 + \frac{4}{3} Rd (1 + (\theta_w - 1)\theta)^3 \right) \frac{\partial \theta}{\partial \eta} \right\} \\ + \left( 1 + \frac{\xi}{\sin \xi} \cos \xi \right) f \frac{\partial \theta}{\partial \eta} + Q\theta + J\xi^2 \left( \frac{\partial f}{\partial \eta} \right)^2 \\ = \xi \left( \frac{\partial f}{\partial \eta} \frac{\partial \theta}{\partial \xi} - \frac{\partial \theta}{\partial \eta} \frac{\partial f}{\partial \xi} \right) \end{aligned} \tag{16}$$

Along with boundary conditions

$$\begin{aligned} f = f' = 0, \quad \theta = 1 \quad \text{at} \quad \eta = 0 \\ f' \rightarrow 0, \quad \theta \rightarrow 0 \quad \text{as} \quad \eta \rightarrow \infty \end{aligned} \tag{17}$$

It can be seen that near the lower stagnation point of the sphere, *i.e.*,  $\xi \approx 0$ , Equations (15) and (16) reduce to the following ordinary differential equations:

$$f''' + 2ff'' - f'^2 + \theta - Mf' = 0 \tag{18}$$

$$\frac{1}{Pr} \left[ \left\{ 1 + \frac{4}{3} Rd(1 + (\theta_w - 1)\theta)^3 \right\} \theta' \right] + 2f\theta' + Q\theta = 0 \tag{19}$$

Subject to the boundary conditions

$$\begin{aligned} f(0) = f'(0) = 0, \quad \theta(0) = 1 \\ f' \rightarrow 0, \quad \theta \rightarrow 0 \quad \text{as } \eta \rightarrow \infty \end{aligned} \tag{20}$$

In practical applications, skin-friction coefficient  $C_f$  and Nusselt number  $Nu$  can be written in non-dimensional form as

$$Nu = \frac{aGr^{-\frac{1}{4}}}{k(T_w - T_\infty)} q_w \quad \text{and} \quad C_f = \frac{a^2Gr^{-\frac{3}{4}}}{\mu\nu} \tau_w \tag{21}$$

where,  $q_w = -k(\partial T/\partial Y)_{Y=0} + (q_r)_{Y=0}$  and  $\tau_w = \mu(\partial U/\partial Y)_{Y=0}$

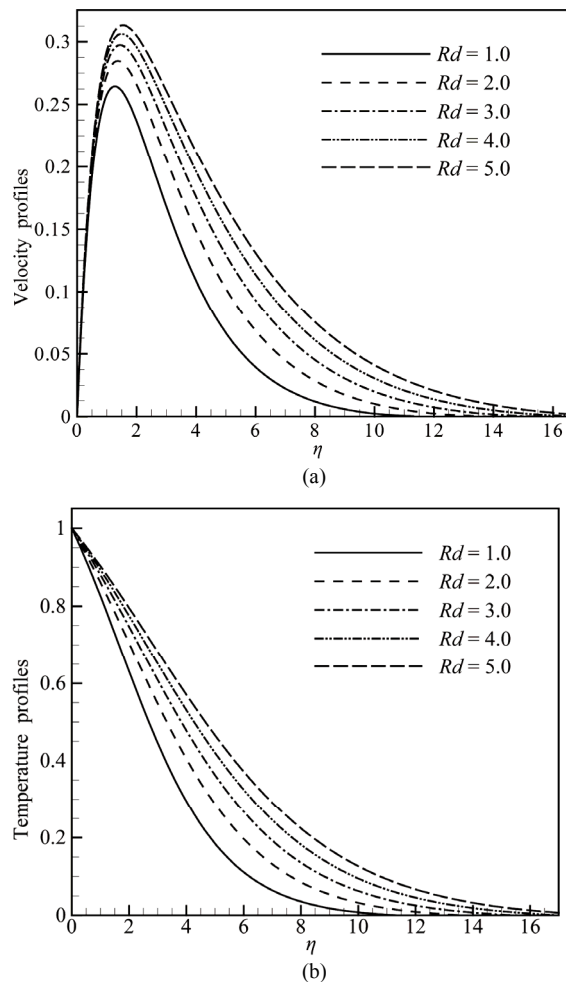

Putting the above values in Equation (21), we have

$$\therefore Nu = - \left( 1 + \frac{4}{3} Rd\theta_w^3 \right) \left( \frac{\partial \theta}{\partial \eta} \right)_{\eta=0} \quad \text{and} \quad C_f = \xi \left( \frac{\partial^2 f}{\partial \eta^2} \right)_{\eta=0} \tag{22}$$

### 3. Results and Discussion

Solutions are obtained for some test values of Prandtl number  $Pr = 2.00, 5.00, 7.00, 9.00$ ; radiation parameter  $Rd = 1.00, 2.00, 3.00, 4.00, 5.00$ ; heat generation parameter  $Q = 0.00, 0.05, 0.10, 0.15, 0.20$ ; magnetic parameter  $M = 0.50, 1.00, 1.50, 2.00, 3.00$  and joule heating parameter  $J = 0.10, 0.50, 1.00, 1.50, 2.00$  in terms of velocity and temperature profiles, skin friction coefficient and heat transfer coefficient. The effects for different values of radiation parameter  $Rd$  the velocity and temperature profiles in case of Prandtl number  $Pr = 0.72$ , heat generation parameter  $Q = 0.10$ , magnetic parameter  $M = 2.00$  and joule heating parameter  $J = 0.50$  are shown in **Figures 2(a)** and **2(b)**. In **Figures 3(a)** and **3(b)** are shown that when the Prandtl number  $Pr$  increases with radiation parameter  $Rd = 1.00$ , heat generation parameter  $Q = 0.10$ , magnetic parameter  $M = 2.00$  and joule heating parameter  $J = 0.50$ , both the velocity and temperature profiles are decrease. For different values of heat generation parameter  $Q$  with radiation parameter  $Rd = 1.00$ , Prandtl number  $Pr = 0.72$ , magnetic parameter  $M = 2.00$  and joule heating parameter  $J = 0.50$  and display results in **Figures 4(a,b)** that as the heat generation parameter  $Q$  increases, the velocity and the temperature profiles increase.

It has been seen from **Figure 5(a)** that as the magnetic parameter  $M$  increases, the velocity profiles decrease up to the position of  $\eta = 4.10555$  after that position velocity profiles increase with the increase of magnetic parameter. We see that in **Figure 5(b)** temperature profiles increase for increasing values of magnetic parameter  $M$  with radiation parameter  $Rd = 1.00$ , Prandtl number  $Pr = 0.72$ , heat generation parameter  $Q = 0.10$  and joule heating parameter  $J = 0.50$ . It has been seen from **Figures 6(a,b)** that as the joule heating parameter  $J$  increases, the velocity and the temperature profiles increase. In **Figures 7(a,b)** shown that the radiation parameter  $Rd$  increases, both the skin friction coefficient and heat transfer coefficient increase. The variation of the local skin friction coefficient  $C_f$  and local rate of heat transfer  $Nu$  for different values of Prandtl number  $Pr$  while radiation parameter  $Rd = 1.00$ , heat generation parameter  $Q = 0.10$ , magnetic parameter  $M = 2.00$  and joule heating parameter  $J = 0.50$  are shown in **Figures 8(a)** and **8(b)**. From

**Figure 2. (a) Velocity and (b) Temperature profiles for different values of  $Rd$  when  $Pr = 0.72, Q = 0.1, M = 2.0$  and  $J = 0.5$ .**

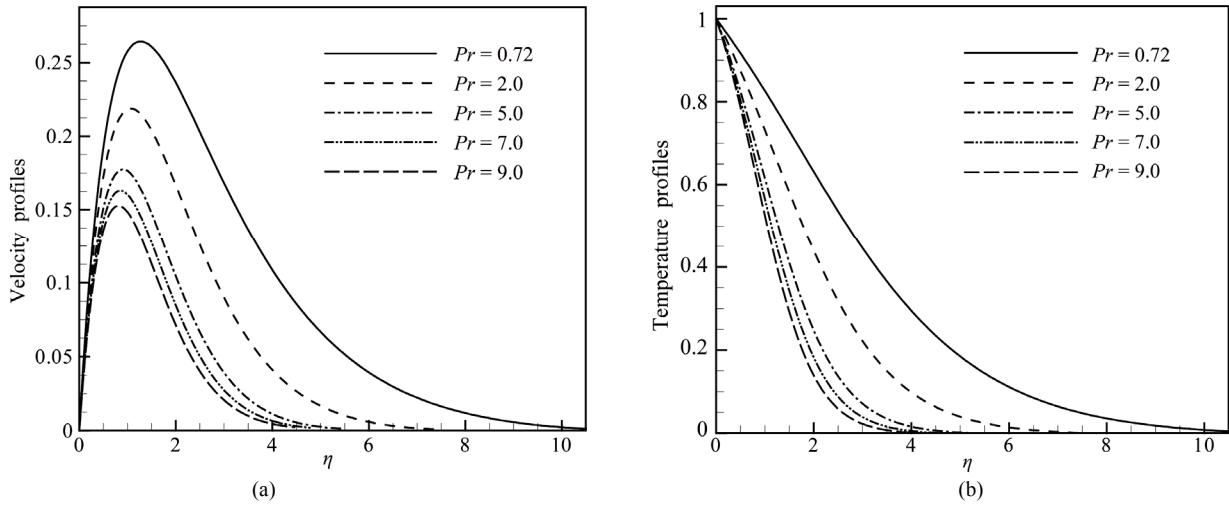

Figure 3. (a) Velocity and (b) Temperature profiles for different values of  $Pr$  when  $Rd = 1.0$ ,  $Q = 0.1$ ,  $M = 2.0$  and  $J = 0.5$ .

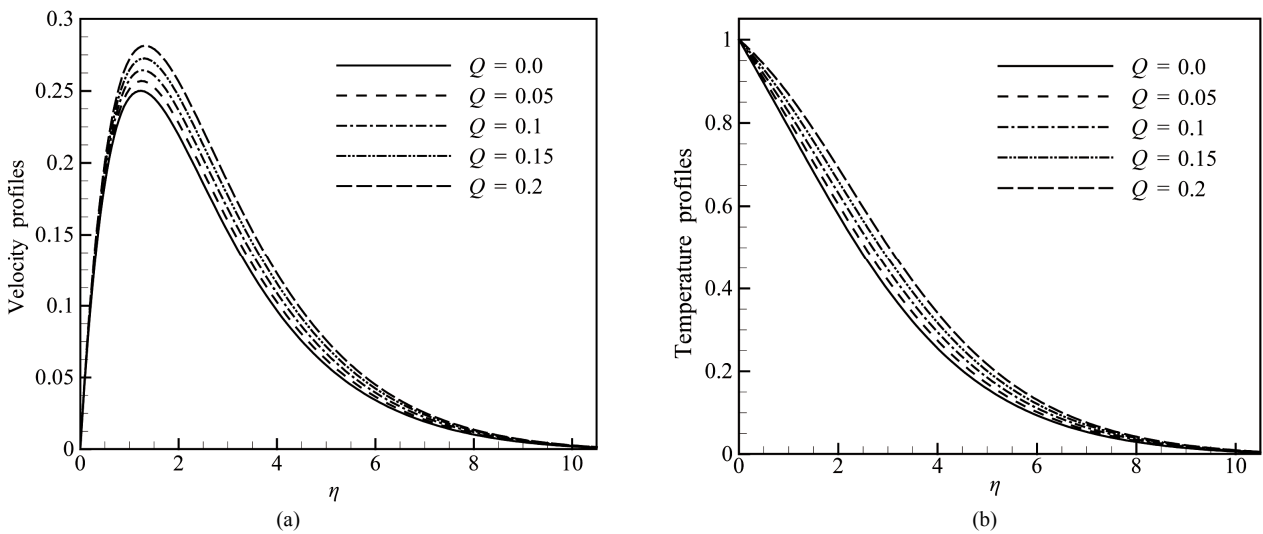

Figure 4. (a) Velocity and (b) Temperature profiles for different values of  $Q$  when  $Rd = 1.0$ ,  $Pr = 0.72$ ,  $M = 2.0$  and  $J = 0.5$ .

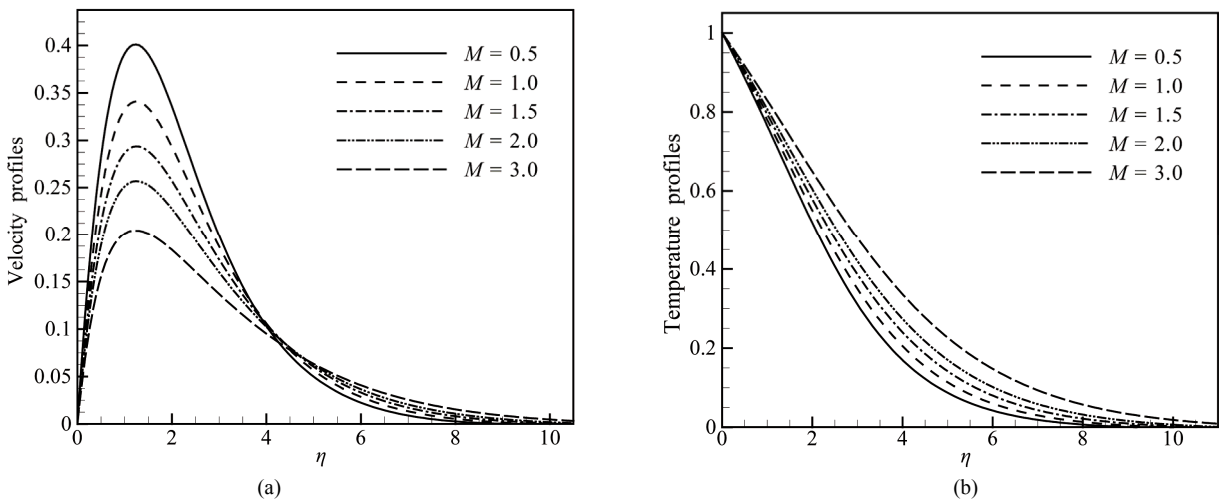

Figure 5. (a) Velocity and (b) Temperature profiles for different values of  $M$  when  $Rd = 1.0$ ,  $Pr = 0.72$ ,  $Q = 0.1$  and  $J = 0.5$ .

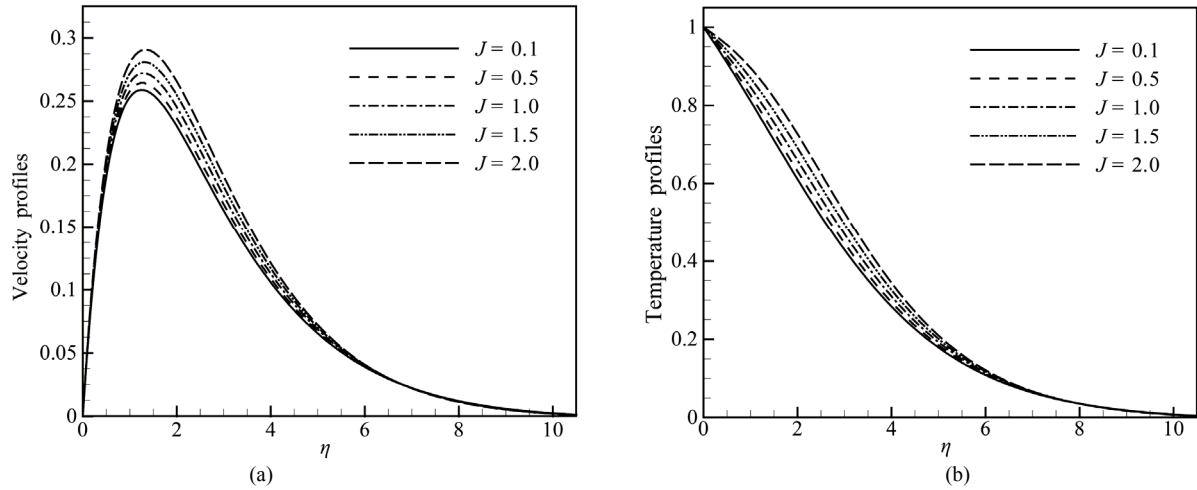

Figure 6. (a) Velocity and (b) Temperature profiles for different values of  $J$  when  $Rd = 1.0, Pr = 0.72, Q = 0.1$  and  $M = 2.0$ .

Figure 7. (a) Skin friction coefficient and (b) Rate of heat transfer for different values of  $Rd$  when  $Pr = 0.72, Q = 0.1, M = 2.0$  and  $J = 0.5$ .

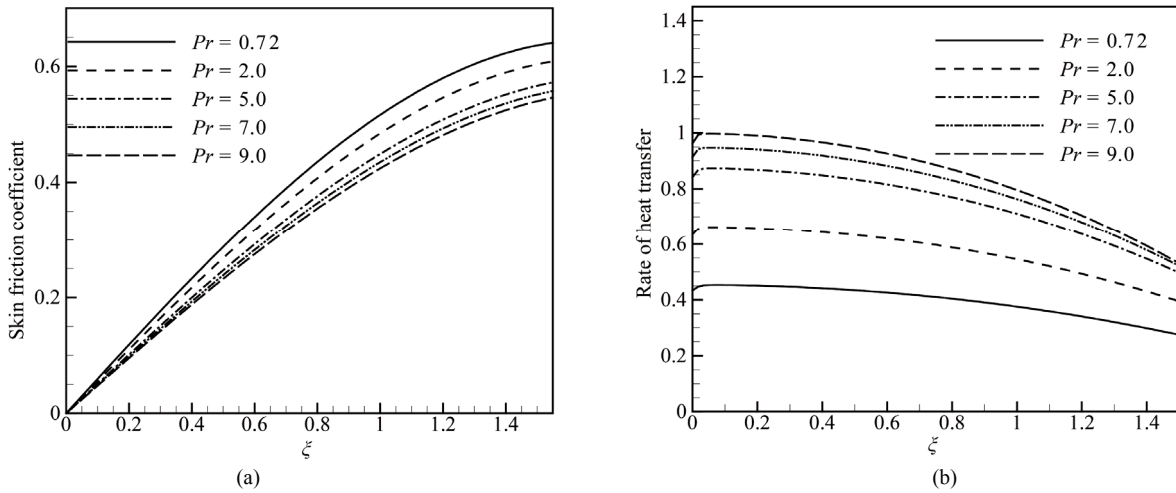

Figure 8. (a) Skin friction coefficient and (b) Rate of heat transfer for different values of  $Pr$  when  $Rd = 1.0, Q = 0.1, M = 2.0$  and  $J = 0.5$ .

**Figure 9(a)** we observed that the skin friction coefficient  $C_f$  increases significantly as the heat generation parameter  $Q$  increases and **Figure 9(b)** show that heat transfer coefficient  $Nu$  decreases for increasing values of heat generation parameter  $Q$  with relevant parameters. It reveals that the rate of heat transfer decreases along the  $\xi$  direction from lower stagnation point to the downstream. **Figures 10(a,b)** shown that skin friction coefficient  $C_f$  and heat transfer coefficient  $Nu$  decrease for increasing values of magnetic parameter  $M$  while radiation parameter  $Rd = 1.00$ , Prandtl number  $Pr = 0.72$ , heat generation parameter  $Q = 0.10$ , and joule heating parameter  $J = 0.50$ . From **Figure 11(a)** we observed that the skin friction coefficient  $C_f$  increases and **Figure 11(b)** shown that heat transfer coefficient  $Nu$  decreases for increasing values of joule heating parameter  $J$ .

### 4 Conclusions

The conjugate effects of radiation and joule heating on magnetohydrodynamic free convection flow along a sphere with heat generation has been investigated for different values of relevant physical parameters including the magnetic parameter  $M$ . From the present investigation the following conclusions may be drawn:

All the velocity profile, temperature profile, the local skin friction coefficient  $C_f$  and the local rate of heat transfer  $Nu$  increase significantly when the values of radiation parameter  $Rd$  increases.

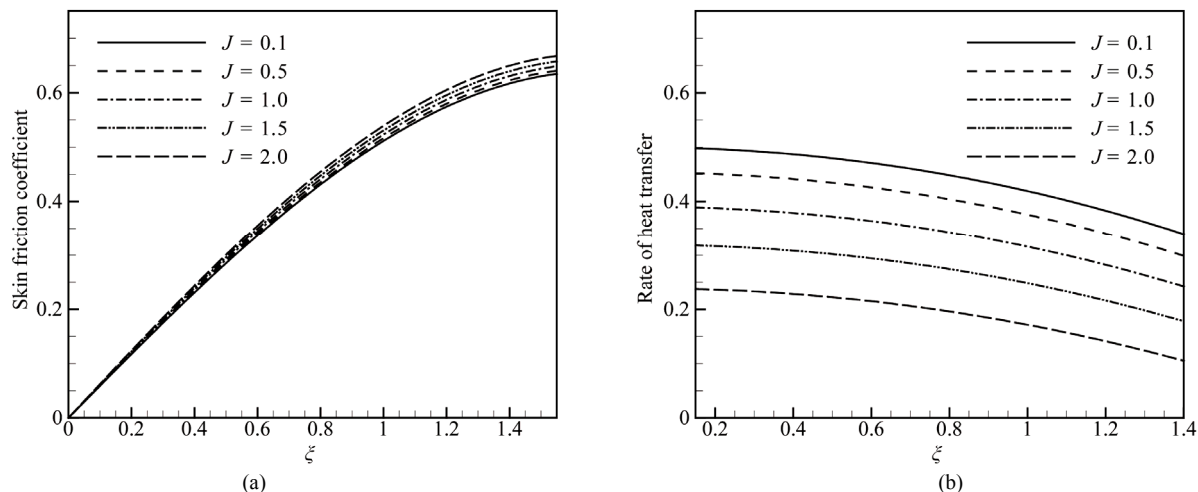

As joule heating parameter  $J$  increases, both the velocity and the temperature profiles increase and also the local skin friction coefficient  $C_f$  and the local rate of heat transfer  $Nu$  increase significantly.

**Figure 9.** (a) Skin friction coefficient and (b) Rate of heat transfer for different values of  $Q$  when  $Rd = 1.0$ ,  $Pr = 0.72$ ,  $M = 2.0$  and  $J = 0.5$ .

**Figure 10.** (a) Skin friction coefficient and (b) Rate of heat transfer for different values of  $M$  when  $Rd = 1.0$ ,  $Pr = 0.72$ ,  $Q = 0.1$  and  $J = 0.5$ .

**Figure 11. (a) Skin friction coefficient and (b) Rate of heat transfer for different values of  $J$  when  $Rd = 1.0$ ,  $Pr = 0.72$ ,  $Q = 0.1$  and  $M = 2.0$ .**

For increasing values of Prandtl number  $Pr$  leads to decrease the velocity profile, the temperature profile and the local skin friction coefficient  $C_f$  but the local rate of heat transfer  $Nu$  increases.

An increase in the values of  $M$  leads to decrease the velocity profiles but to increase the temperature profiles and also both the local skin friction coefficient  $C_f$  and the local rate of heat transfer  $Nu$  decrease.

**Nomenclature**

---

$a$	Radius of the sphere (m)
$B_0$	Strength of magnetic field (A/m)
$C_f$	Skin-friction coefficient
$C_p$	Specific heat at constant pressure ( $\text{Jkg}^{-1}\text{k}^{-1}$ )
$f$	Dimensionless stream function
$f'$	Derivative of $f$ with respect to $\eta$
$g$	Acceleration due to gravity ( $\text{ms}^{-2}$ )
$Gr$	Grashof number
$J$	Joule heating parameter
$k$	Thermal conductivity ( $\text{wm}^{-1}\text{k}^{-1}$ )
$M$	Magnetic parameter
$Nu$	Nusselt number
$Pr$	Prandtl number
$q_r$	Radiative heat flux ( $\text{w/m}^2$ )
$q_c$	Conduction heat flux ( $\text{w/m}^2$ )
$q_w$	Heat flux at the surface ( $\text{w/m}^2$ )
$Q_0$	Heat generation constant
$Q$	Heat generation Parameter
$Rd$	Radiation parameter
$r$	Radial distance from the symmetric axis to the surface (m)
$T$	Temperature of the fluid in the boundary layer (K)
$T_\infty$	Temperature of the ambient fluid (K)
$T_w$	Temperature at the surface (K)
$U$	Velocity component along the surface ( $\text{ms}^{-1}$ )
$V$	Velocity component normal to the surface ( $\text{ms}^{-1}$ )
$u$	Dimensionless velocity along the surface
$v$	Dimensionless velocity normal to the surface
$X$	Coordinate along the surface (m)
$Y$	Coordinate normal to the surface (m)
