## ABSTRACT

We propose a new class of algebraic structure named as  $(m, n)$ -semihyperring which is a generalization of usual *semihyperring*. We define the basic properties of  $(m, n)$ -semihyperring like identity elements, weak distributive  $(m, n)$ -semihyperring, zero sum free, additively idempotent, hyperideals, homomorphism, inclusion homomorphism, congruence relation, quotient  $(m, n)$ -semihyperring etc. We propose some lemmas and theorems on homomorphism, congruence relation, quotient  $(m, n)$ -semihyperring, etc. and prove these theorems. We further extend it to introduce the relationship between fuzzy sets and  $(m, n)$ -semihyperrings and propose fuzzy hyperideals and homomorphism theorems on fuzzy  $(m, n)$ -semihyperrings and the relationship between fuzzy  $(m, n)$ -semihyperrings and the usual  $(m, n)$ -semihyperrings.

**Keywords:**  $(m, n)$ -Semihyperring; Hyperoperation; Hyperideal; Homomorphism; Congruence Relation; Fuzzy  $(m, n)$ -Semihyperring

## 1. Introduction

A semihyperring is essentially a semiring in which addition is a hyperoperation [1]. Semihyperring is in active research for a long time. Vougiouklis [2] generalize the concept of hyperring  $(\mathcal{R}, \oplus, \square)$  by dropping the reproduction axiom where  $\oplus$  and  $\square$  are associative hyper operations and  $\square$  distributes over  $\oplus$  and named it as semihyperring. Chaopraknoi, Hobuntud and Pianskool [3] studied semihyperring with zero. Davvaz and Pour-salavati [4] introduced the matrix representation of poly-groups over hyperring and also over semihyperring. Semihyperring and its ideals are studied by Ameri and Hedayati [5].

Zadeh [6] introduced the notion of a fuzzy set that is used to formulate some of the basic concepts of algebra. It is extended to fuzzy hyperstructures, nowadays fuzzy hyperstructure is a fascinating research area. Davvaz introduced the notion of fuzzy subhypergroups in [7], Ameri and Nozari [8] introduced fuzzy regular relations and fuzzy strongly regular relations of fuzzy hyperalgebras and also established a connection between fuzzy hyperalgebras and algebras. Fuzzy subhypergroup is also studied by Cristea [9]. Fuzzy hyperideals of semihyperrings are studied by [1,10,11].

The generalization of Krasner hyperring is introduced by Mirvakili and Davvaz [12] that is named as Krasner  $(m, n)$  hyperring. In [13] Davvaz studied the fuzzy hyperideals of the Krasner  $(m, n)$ -hyperring. Generalization of hyperstructures are also studied by [1,14-16].

In this paper, we introduce the notion of the generalization of usual semihyperring and called it as  $(m, n)$ -semihyperring and set fourth some of its properties, we also introduce fuzzy  $(m, n)$ -semihyperring and its basic properties and the relation between fuzzy  $(m, n)$ -semihyperring and its associated  $(m, n)$ -semihyperring.

The paper is arranged in the following fashion:

Section 2 describes the notations used and the general conventions followed. Section 3 deals with the definitions of  $(m, n)$ -semihyperring, weak distributive  $(m, n)$ -semihyperring, hyperadditive and multiplicative identity elements, zero, zero sum free, additively idempotent and some examples of  $(m, n)$ -semihyperrings.

Section 4 describes the properties of  $(m, n)$ -semihyperring. This section deals with the definitions of hyperideals, homomorphism, congruence relation, quotient of  $(m, n)$ -semihyperring and also the theorems based on these definitions.

Section 5 deals with the fuzzy  $(m, n)$ -semihyperrings, fuzzy hyperideals and homomorphism theorems on  $(m, n)$ -semihyperrings and fuzzy  $(m, n)$ -semihyperrings.

## 2. Preliminaries

Let  $\mathcal{H}$  be a non-empty set and  $\mathcal{P}^*(\mathcal{H})$  be the set of all non-empty subsets of  $\mathcal{H}$ . A hyperoperation on  $\mathcal{H}$  is a map  $\sigma: \mathcal{H} \times \mathcal{H} \rightarrow \mathcal{P}^*(\mathcal{H})$  and the couple  $(\mathcal{H}, \sigma)$  is called a hypergroupoid. If  $A$  and  $B$  are non-empty subsets of  $\mathcal{H}$ , then we denote  $A\sigma B = \bigcup_{a \in A, b \in B} a\sigma b$ ,

$$x\sigma A = \{x\}\sigma A \text{ and } A\sigma x = A\sigma\{x\}.$$

Let  $\mathcal{H}$  be a non-empty set,  $\mathcal{P}^*$  be the set of all non-empty subsets of  $\mathcal{H}$  and a mapping  $f: \mathcal{H}^m \rightarrow \mathcal{P}^*(\mathcal{H})$  is called an  $m$ -ary hyperoperation and  $m$  is called the *arity of hyperoperation* [14].

A hypergroupoid  $(\mathcal{H}, \sigma)$  is called a *semihypergroup* if for all  $x, y, z \in \mathcal{H}$  we have  $(x\sigma y)\sigma z = x\sigma(y\sigma z)$  which means that

$$\bigcup_{u \in x\sigma y} u\sigma z = \bigcup_{v \in y\sigma z} x\sigma v.$$

Let  $f$  be an  $m$ -ary hyperoperation on  $\mathcal{H}$  and  $A_1, A_2, \dots, A_m$  subsets of  $\mathcal{H}$ . We define

$$f(A_1, A_2, \dots, A_m) = \bigcup_{x_i \in A_i} f(x_1, x_2, \dots, x_m)$$

for all  $1 \leq i \leq m$ .

**Definition 2.1**  $(\mathcal{H}, \oplus, \otimes)$  is a semihyperring which satisfies the following axioms:

- 1)  $(\mathcal{H}, \oplus)$  is a semihypergroup;
- 2)  $(\mathcal{H}, \otimes)$  is a semigroup and;
- 3)  $\otimes$  distributes over  $\oplus$ ,

$$x \otimes (y \oplus z) = (x \otimes y) \oplus (x \otimes z) \text{ and } (y \oplus z) \otimes x = (y \otimes x) \oplus (z \otimes x) \text{ for all } x, y, z \in \mathcal{H} \text{ [3].}$$

**Example 2.2** Let  $(\mathcal{H}, +, \times)$  be a semiring, we define

- 1)  $x \oplus y = \langle x, y \rangle$
- 2)  $x \otimes y = x \times y$

Then  $(\mathcal{H}, \oplus, \otimes)$  is a semihyperring.

An element 0 of a semihyperring  $(\mathcal{H}, \oplus, \otimes)$  is called a *zero* of  $(\mathcal{H}, \oplus, \otimes)$  if  $x \oplus 0 = 0 \oplus x = \{x\}$  and  $x \otimes 0 = 0 \otimes x = 0$  [3].

The set of integers is denoted by  $\mathbb{Z}$ , with  $\mathbb{Z}_+$  and  $\mathbb{Z}_-$  denoting the sets of positive integers and negative integers respectively. Elements of the set  $\mathcal{H}$  are denoted by  $x_i, y_i$  where  $i \in \mathbb{Z}_+$ .

We use following general convention as followed by [10,17-19]:

The sequence  $x_i, x_{i+1}, \dots, x_m$  is denoted by  $x_i^m$ .

The following term:

$$f(x_1, \dots, x_i, y_{i+1}, \dots, y_j, z_{j+1}, \dots, z_m) \tag{1}$$

is represented as:

$$f(x_1^i, y_{i+1}^j, z_{j+1}^m) \tag{2}$$

In the case when  $y_{i+1} = \dots = y_j = y$ , then (2) is expressed as:

$$f\left(x_1^i, y, z_{j+1}^m\right)^{(j-i)}$$

**Definition 2.3** A non-empty set  $\mathcal{H}$  with an  $m$ -ary hyperoperation  $f: \mathcal{H}^m \rightarrow \mathcal{P}^*(\mathcal{H})$  is called an  $m$ -ary hypergroupoid and is denoted as  $(\mathcal{H}, f)$ . An  $m$ -ary hypergroupoid  $(\mathcal{H}, f)$  is called an  $m$ -ary semihypergroup if and only if the following associative axiom holds:

$$f(x_1^i, f(x_i^{m+i-1}), x_{m+1}^{2m-1}) = f(x_1^i, f(x_j^{m+j-1}), x_{m+j}^{2m-1})$$

for all  $i, j \in \{1, 2, \dots, m\}$  and  $x_1, x_2, \dots, x_{2m-1} \in \mathcal{H}$  [14].

**Definition 2.4** Element  $e$  is called *identity element* of hypergroup  $(\mathcal{H}, f)$  if

$$x \in f\left(\underbrace{e, \dots, e}_{i-1}, x, \underbrace{e, \dots, e}_{n-i}\right)$$

for all  $x \in \mathcal{H}$  and  $1 \leq i \leq n$  [14].

**Definition 2.5** A non-empty set  $\mathcal{H}$  with an  $n$ -ary operation  $g$  is called an  $n$ -ary groupoid and is denoted by  $(\mathcal{H}, g)$  [19].

**Definition 2.6** An  $n$ -ary groupoid  $(\mathcal{H}, g)$  is called an  $n$ -ary semigroup if  $g$  is associative, i.e.,

$$g(x_1^i, g(x_i^{n+i-1}), x_{n+i}^{2n-1}) = g(x_1^i, g(x_j^{n+j-1}), x_{n+j}^{2n-1})$$

for all  $i, j \in \{1, 2, \dots, n\}$  and  $x_1, x_2, \dots, x_{2n-1} \in \mathcal{H}$  [19].

### 3. Definitions and Examples of $(m, n)$ -Semihyperring

**Definition 3.1**  $(\mathcal{H}, f, g)$  is an  $(m, n)$ -semihyperring which satisfies the following axioms:

- 1)  $(\mathcal{H}, f)$  is a  $m$ -ary semihypergroup;
- 2)  $(\mathcal{H}, g)$  is an  $n$ -ary semigroup;
- 3)  $g$  is distributive over  $f$  i.e.,

$$g(x_1^{i-1}, f(a_1^m), x_{i+1}^n) = f(g(x_1^{i-1}, a_1, x_{i+1}^n), \dots, g(x_1^{i-1}, a_m, x_{i+1}^n)).$$

**Remark 3.2** An  $(m, n)$ -semihyperring is called *weak distributive* if it satisfies Definition 3.1 1), 2) and the following:

$$g(x_1^{i-1}, f(a_1^m), x_{i+1}^n) \subseteq f(g(x_1^{i-1}, a_1, x_{i+1}^n), \dots, g(x_1^{i-1}, a_m, x_{i+1}^n)).$$

Remark 3.2 is generalization of [20].

**Example 3.3** Let  $\mathbb{Z}$  be the set of all integers. Let the binary hyperoperation  $\oplus$  and an  $n$ -ary operation  $g$  on  $\mathbb{Z}$  which are defined as follows:

$$x_1 \oplus x_2 = \{x_1, x_2\}$$

and

$$g(x_1, x_2, \dots, x_n) = \prod_{i=1}^n x_i.$$

Then  $(\mathbb{Z}, \oplus, g)$  is called a  $(2, n)$ -semihyperring.

Example 3.3 is generalization of Example 1 of [1].

**Definition 3.4** Let  $e$  be the *hyper additive identity element* of hyperoperation  $f$  and  $e'$  be *multiplicative identity element* of operation  $g$  then

$$x \in f\left(\underbrace{e, \dots, e}_{i-1}, x, \underbrace{e, \dots, e}_{m-i}\right)$$

for all  $x \in \mathcal{H}$  and  $1 \leq i \leq m$  and

$$y = g \left( \underbrace{e', \dots, e'}_{j-1}, y, \underbrace{e', \dots, e'}_{n-j} \right)$$

for all  $y \in \mathcal{H}$  and  $1 \leq j \leq n$ .

**Definition 3.5** An element  $\mathbf{0}$  of an  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  is called a *zero* of  $(\mathcal{H}, f, g)$  if

$$f \left( \underbrace{\mathbf{0}, \dots, \mathbf{0}}_{m-1}, x \right) = f \left( x, \underbrace{\mathbf{0}, \dots, \mathbf{0}}_{m-1} \right) = x$$

for all  $x \in \mathcal{H}$ .

$$g \left( \underbrace{\mathbf{0}, \dots, \mathbf{0}}_{n-1}, y \right) = g \left( y, \underbrace{\mathbf{0}, \dots, \mathbf{0}}_{n-1} \right) = \mathbf{0}$$

for all  $y \in \mathcal{H}$ .

**Remark 3.6** Let  $(\mathcal{H}, f, g)$  be an  $(m, n)$ -semihyperring and  $e$  and  $e'$  be hyper additive identity and multiplicative identity elements respectively, then we can obtain the additive hyper operation and multiplication as follows:

$$\langle x, y \rangle = f \left( x, \underbrace{e, \dots, e}_{m-2}, y \right)$$

and  $x \times y = g \left( x, \underbrace{e', \dots, e'}_{n-2}, y \right)$  for all  $x, y \in \mathcal{H}$ .

**Definition 3.7** Let  $(\mathcal{H}, f, g)$  be an  $(m, n)$ -semihyperring.

1)  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  is called *zero sum free* if and only if  $\mathbf{0} \in f(x_1, x_2, \dots, x_m)$  implies

$$x_1 = x_2 = \dots = x_m = \mathbf{0}.$$

2)  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  is called *additively idempotent* if  $(\mathcal{H}, f)$  be a  $m$ -ary semihypergroup, i.e. if  $f(x, x, \dots, x) \in x$ .

### 4. Properties of $(m, n)$ -Semihyperring

**Definition 4.1** Let  $(\mathcal{H}, f, g)$  be an  $(m, n)$ -semihyperring.

1) An  $m$ -ary sub-semihypergroup  $\mathcal{R}$  of  $\mathcal{H}$  is called an  $(m, n)$ -sub-semihyperring of  $\mathcal{H}$  if  $g(a_1^n) \in \mathcal{R}$ , for all  $a_1, a_2, \dots, a_n \in \mathcal{R}$ .

2) An  $m$ -ary sub-semihypergroup  $\mathcal{I}$  of  $\mathcal{H}$  is called

a) a left hyperideal of  $\mathcal{H}$  if  $g(a_1^{n-1}, i) \in \mathcal{I}$ ,

$$\forall a_1, a_2, \dots, a_{n-1} \in \mathcal{H} \text{ and } i \in \mathcal{I}.$$

b) a right hyperideal of  $\mathcal{H}$  if  $g(i, a_1^{n-1}) \in \mathcal{I}$ ,

$$\forall a_1, a_2, \dots, a_{n-1} \in \mathcal{H} \text{ and } i \in \mathcal{I}.$$

If  $\mathcal{I}$  is both left and right hyperideal then it is called as an hyperideal of  $\mathcal{H}$ .

c) a left hyperideal  $\mathcal{I}$  of an  $(m, n)$ -semihyperring of  $\mathcal{H}$  is called *weak left hyperideal* of  $\mathcal{H}$  if for  $i \in \mathcal{I}$  and  $x_1, x_2, \dots, x_{m-1} \in \mathcal{H}$  then  $f(i, x_1^{m-1}) \subseteq \mathcal{I}$  or  $f(x_1^{m-1}, i) \subseteq \mathcal{I}$  implies  $x_1, x_2, \dots, x_{m-1} \in \mathcal{I}$ .

Definition 4.1 is generalization of [21].

**Proposition 4.2** A left hyperideal of an  $(m, n)$ -semi-

hyperring is an  $(m, n)$ -sub-semihyperring.

**Definition 4.3** Let  $(\mathcal{H}, f, g)$  and  $(\mathcal{S}, f', g')$  be two  $(m, n)$ -semihyperrings. The mapping  $\sigma: \mathcal{H} \rightarrow \mathcal{S}$  is called a *homomorphism* if following condition is satisfied for all  $x_1, x_2, \dots, x_m, y_1, y_2, \dots, y_n \in \mathcal{H}$ .

$$\sigma \left( f(x_1, x_2, \dots, x_m) \right) = f' \left( \sigma(x_1), \sigma(x_2), \dots, \sigma(x_m) \right)$$

and

$$\sigma \left( g(y_1, y_2, \dots, y_n) \right) = g' \left( \sigma(y_1), \sigma(y_2), \dots, \sigma(y_n) \right).$$

**Remark 4.4** Let  $(\mathcal{H}, f, g)$  and  $(\mathcal{S}, f', g')$  be two  $(m, n)$ -semihyperrings. The mapping  $\sigma: \mathcal{H} \rightarrow \mathcal{S}$  for all  $x_1, x_2, \dots, x_m, y_1, y_2, \dots, y_n \in \mathcal{H}$  is called an *inclusion homomorphism* if following relations hold:

$$\sigma \left( f(x_1, x_2, \dots, x_m) \right) \subseteq f' \left( \sigma(x_1), \sigma(x_2), \dots, \sigma(x_m) \right)$$

and

$$\sigma \left( g(y_1, y_2, \dots, y_n) \right) \subseteq g' \left( \sigma(y_1), \sigma(y_2), \dots, \sigma(y_n) \right)$$

Remark 4.4 is generalization of [7].

**Theorem 4.5** Let  $(\mathcal{R}, f, g)$ ,  $(\mathcal{S}, f', g')$  and  $(\mathcal{T}, f'', g'')$  be  $(m, n)$ -semihyperrings. If mappings  $\sigma: (\mathcal{R}, f, g) \rightarrow (\mathcal{S}, f', g')$  and  $\delta: (\mathcal{S}, f', g') \rightarrow (\mathcal{T}, f'', g'')$  are homomorphisms, then  $\sigma \circ \delta: (\mathcal{R}, f, g) \rightarrow (\mathcal{T}, f'', g'')$  is also a homomorphism.

*Proof.* Omitted as obvious.

**Definition 4.6** Let  $\cong$  be an equivalence relation on the  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  and  $A_i$  and  $B_i$  be the subsets of  $\mathcal{H}$  for all  $1 \leq i \leq m$ . We define  $A_i \cong B_i$  for all  $a_i \in A_i$  there exists  $b'_i \in B_i$  such that  $a_i \cong b'_i$  holds true and for all  $b_i \in B_i$  there exists  $a'_i \in A_i$  such that  $a'_i \cong b_i$  holds true [22].

An equivalence relation  $\cong$  is called a *congruence relation* on  $\mathcal{H}$  if following hold:

1) for all  $a_1, a_2, \dots, a_m, b_1, b_2, \dots, b_m \in \mathcal{H}$ ; if  $\{a_i\} \cong \{b_i\}$  then  $\{f(a_1^m)\} \cong \{f(b_1^m)\}$ , where  $1 \leq i \leq m$  and,

2) for all  $x_1, x_2, \dots, x_n, y_1, y_2, \dots, y_n \in \mathcal{H}$ ; if  $x_j \cong y_j$  then  $g(x_1^n) \cong g(y_1^n)$ , where  $1 \leq j \leq n$  [23].

**Lemma 4.7** Let  $(\mathcal{H}, f, g)$  be an  $(m, n)$ -semihyperring and  $\cong$  be the congruence relation on  $\mathcal{H}$  then

1) if  $\{x\} \cong \{y\}$  then

$$\{f(x, a_1^{m-1})\} \cong \{f(y, a_1^{m-1})\}$$

for all  $x, y, a_1, a_2, \dots, a_m \in \mathcal{H}$

2) if  $x \cong y$  then following holds:

$$g(a_1^{i-1}, x, a_{i+1}^n) \cong g(a_1^{i-1}, y, a_{i+1}^n)$$

for all  $x, y, a_1, a_2, \dots, a_n \in \mathcal{H}$

*Proof.*

1) Given that

$$\{x\} \cong \{y\} \tag{3}$$

for all  $x, y \in \mathcal{H}$ . Let  $e$  be the hyper additive identity element, then (3) can be represented as follows:

$$f\left(x, \underbrace{e, \dots, e}_{m-1}\right) \cong f\left(y, \underbrace{e, \dots, e}_{m-1}\right) \tag{4}$$

do  $f$  hyperoperation on both sides of (4) with  $a_1$  to get

$$\begin{aligned} & f\left(f\left(x, \underbrace{e, \dots, e}_{m-1}\right), \underbrace{a_1, e, \dots, e}_{m-2}\right) \\ & \cong f\left(f\left(y, \underbrace{e, \dots, e}_{m-1}\right), \underbrace{a_1, e, \dots, e}_{m-2}\right) \end{aligned} \tag{5}$$

$$\begin{aligned} & f\left(f\left(x, \underbrace{a_1, e, \dots, e}_{m-2}\right), \underbrace{e, \dots, e}_{m-1}\right) \\ & \cong f\left(f\left(y, \underbrace{a_1, e, \dots, e}_{m-2}\right), \underbrace{e, \dots, e}_{m-1}\right) \end{aligned} \tag{6}$$

$$\left\{f\left(x, \underbrace{a_1, e, \dots, e}_{m-2}\right)\right\} \cong \left\{f\left(y, \underbrace{a_1, e, \dots, e}_{m-2}\right)\right\} \tag{7}$$

do  $f$  hyperoperation on both sides of (7) with  $a_2$  to get the following equation:

$$\begin{aligned} & f\left(f\left(x, \underbrace{a_1, e, \dots, e}_{m-2}\right), \underbrace{a_2, e, \dots, e}_{m-2}\right) \\ & \cong f\left(f\left(y, \underbrace{a_1, e, \dots, e}_{m-2}\right), \underbrace{a_2, e, \dots, e}_{m-2}\right) \end{aligned} \tag{8}$$

$$\begin{aligned} & f\left(f\left(x, \underbrace{a_1, a_2, e, \dots, e}_{m-3}\right), \underbrace{e, \dots, e}_{m-1}\right) \\ & \cong f\left(f\left(y, \underbrace{a_1, a_2, e, \dots, e}_{m-3}\right), \underbrace{e, \dots, e}_{m-1}\right) \end{aligned} \tag{9}$$

$$\begin{aligned} & \left\{f\left(x, \underbrace{a_1, a_2, e, \dots, e}_{m-3}\right)\right\} \\ & \cong \left\{f\left(f\left(y, \underbrace{a_1, a_2, e, \dots, e}_{m-3}\right), \underbrace{e, \dots, e}_{m-1}\right)\right\} \end{aligned} \tag{10}$$

Similarly we can do  $f$  hyperoperation till  $a_{m-1}$  to get the following result:

$$\left\{f\left(x, a_1, a_2, \dots, a_{m-1}\right)\right\} \cong \left\{f\left(y, a_1, a_2, \dots, a_{m-1}\right)\right\} \tag{11}$$

Which can also be represented as:

$$\left\{f\left(x, a_1^{m-1}\right)\right\} \cong \left\{f\left(y, a_1^{m-1}\right)\right\} \tag{12}$$

2) Given that

$$x \cong y \tag{13}$$

for all  $x, y \in \mathcal{H}$ . Let  $e'$  be the multiplicative identity

element

$$g\left(x, \underbrace{e', \dots, e'}_{n-1}\right) \cong g\left(y, \underbrace{e', \dots, e'}_{n-1}\right) \tag{14}$$

do  $g$  hyperoperation on both sides of (14) with  $a_1$  to get

$$\begin{aligned} & g\left(g\left(x, \underbrace{e', \dots, e'}_{n-1}\right), \underbrace{a_1, e', \dots, e'}_{n-2}\right) \\ & \cong g\left(g\left(y, \underbrace{e', \dots, e'}_{n-1}\right), \underbrace{a_1, e', \dots, e'}_{n-2}\right) \end{aligned} \tag{15}$$

$$\begin{aligned} & g\left(g\left(x, \underbrace{a_1, e', \dots, e'}_{n-2}\right), \underbrace{e', \dots, e'}_{n-1}\right) \\ & \cong g\left(g\left(y, \underbrace{a_1, e', \dots, e'}_{n-2}\right), \underbrace{e', \dots, e'}_{n-1}\right) \end{aligned} \tag{16}$$

$$g\left(x, \underbrace{a_1, e', \dots, e'}_{n-2}\right) \cong g\left(y, \underbrace{a_1, e', \dots, e'}_{n-2}\right) \tag{17}$$

do  $g$  hyperoperation on both sides of (17) with  $a_2$  to get the following equation:

$$\begin{aligned} & g\left(g\left(x, \underbrace{a_1, e', \dots, e'}_{n-2}\right), \underbrace{a_2, e', \dots, e'}_{n-2}\right) \\ & \cong g\left(g\left(y, \underbrace{a_1, e', \dots, e'}_{n-2}\right), \underbrace{a_2, e', \dots, e'}_{n-2}\right) \end{aligned} \tag{18}$$

$$\begin{aligned} & g\left(g\left(x, \underbrace{a_1, a_2, e', \dots, e'}_{n-3}\right), \underbrace{e', \dots, e'}_{n-1}\right) \\ & \cong g\left(g\left(y, \underbrace{a_1, a_2, e', \dots, e'}_{n-3}\right), \underbrace{e', \dots, e'}_{n-1}\right) \end{aligned} \tag{19}$$

$$\begin{aligned} & g\left(x, \underbrace{a_1, a_2, e', \dots, e'}_{n-3}\right) \\ & \cong g\left(g\left(y, \underbrace{a_1, a_2, e', \dots, e'}_{n-3}\right), \underbrace{e', \dots, e'}_{n-1}\right) \end{aligned} \tag{20}$$

Similarly we can do  $g$  operation till  $a_{n-1}$  to get the following result:

$$g\left(x, a_1^{n-1}\right) \cong g\left(y, a_1^{n-1}\right).$$

**Theorem 4.8** Let  $(\mathcal{H}, f, g)$  be an  $(m, n)$ -semihyperperring and  $\cong$  be the congruence relation on  $\mathcal{H}$ . Then if  $\{a_i\} \cong \{b_i\}$  and  $\{x_j\} \cong \{y_j\}$  for all  $a_i, b_i, x_j, y_j \in \mathcal{H}$  and  $i, j \in \{1, m\}$  then the following is obtained: for all  $1 \leq k \leq m$

$$\left\{f\left(a_1^k, x_{k+1}^m\right)\right\} \cong \left\{f\left(b_1^k, y_{k+1}^m\right)\right\}$$

*Proof.* Can be proved similar to Lemma 4.7.

**Definition 4.9** Let  $\cong$  be a congruence on  $\mathcal{H}$ . Then the quotient of  $\mathcal{H}$  by  $\cong$ , written as  $\mathcal{H}/\cong$ , is the algebra whose universe is  $\mathcal{H}/\cong$  and whose fundamental operation satisfy

$$f^{\mathcal{H}/\cong}(x_1, x_2, \dots, x_m) = f^{\mathcal{H}}(x_1, x_2, \dots, x_m) / \cong$$

where  $x_1, x_2, \dots, x_m \in \mathcal{H}$  [23].

**Theorem 4.10** Let  $(\mathcal{H}, f, g)$  be an  $(m, n)$ -semihyperring and  $\cong$  be the equivalence relation and strongly regular on  $\mathcal{H}$  then  $(\mathcal{H}/\cong, f, g)$  is also an  $(m, n)$ -semihyperring.

**Definition 4.11** Let  $(\mathcal{H}, f, g)$  be an  $(m, n)$ -semihyperring and  $\cong$  be the congruence relation. The natural map  $v_{\cong} : \mathcal{H} \rightarrow \mathcal{H}/\cong$  is defined by  $v_{\cong}(a_i) = a_i / \cong$  and  $v_{\cong}(b_j) = b_j / \cong$  where  $a_i, b_j \in \mathcal{H}$  for all  $1 \leq i \leq m$ ,  $1 \leq j \leq n$ .

**Theorem 4.12** Let  $\rho$  and  $\sigma$  be two congruence relations on  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  such that  $\rho \subseteq \sigma$ . Then

$$\sigma/\rho = \{(\rho(x), \rho(y)) \in \mathcal{H}/\rho \times \mathcal{H}/\rho : (x, y) \in \sigma\}$$

is a congruence on  $\mathcal{H}/\rho$  and  $(\mathcal{H}/\rho)/(\sigma/\rho) \cong \mathcal{H}/\sigma$ .

*Proof.* Similar to [24], we can deduce that  $\sigma/\rho$  is an equivalence relation on  $\mathcal{H}/\rho$ . Suppose  $(a_i/\rho)(\sigma/\rho)(b_j/\rho)$  for all  $1 \leq i \leq m$  and  $(c_j/\rho)(\sigma/\rho)(d_j/\rho)$  for all  $1 \leq j \leq n$ . Since  $\sigma$  is congruence on  $\mathcal{H}$  therefore  $f(a_i^m)\sigma f(b_j^m)$  and  $g(c_j^n)\sigma g(d_j^n)$  which implies  $f(a_i^m)\rho(\sigma/\rho)f(b_j^m)\rho$  and  $g(c_j^n)\rho(\sigma/\rho)g(d_j^n)\rho$  respectively, therefore  $\sigma/\rho$  is a congruence on  $\mathcal{H}/\rho$ .

**Theorem 4.13** The natural map from an  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  to the quotient  $(\mathcal{H}/\cong, f, g)$  of the  $(m, n)$ -semihyperring is an onto homomorphism.

Definition 4.11 and Theorem 4.13 is generalization of [23].

*Proof.* let  $\cong$  be the congruence relation on  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  and the natural map be  $v_{\cong} : \mathcal{H} \rightarrow \mathcal{H}/\cong$ . For all  $a_i \in \mathcal{H}$ , where  $1 \leq i \leq m$  following holds true:

$$\begin{aligned} & v_{\cong} f^{\mathcal{H}}(a_1, a_2, \dots, a_m) \\ &= f^{\mathcal{H}}(a_1, a_2, \dots, a_m) / \cong \\ &= f^{\mathcal{H}/\cong}(a_1 / \cong, a_2 / \cong, \dots, a_m / \cong) \\ &= f^{\mathcal{H}/\cong}(v_{\cong} a_1, v_{\cong} a_2, \dots, v_{\cong} a_m) \end{aligned}$$

In a similar fashion we can deduce for  $g$ , for all  $b_j \in \mathcal{H}$ , where  $1 \leq j \leq n$ :

$$\begin{aligned} & v_{\cong} g^{\mathcal{H}}(b_1, b_2, \dots, b_n) \\ &= g^{\mathcal{H}}(b_1, b_2, \dots, b_n) / \cong \\ &= g^{\mathcal{H}/\cong}(b_1 / \cong, b_2 / \cong, \dots, b_n / \cong) \\ &= g^{\mathcal{H}/\cong}(v_{\cong} b_1, v_{\cong} b_2, \dots, v_{\cong} b_n) \end{aligned}$$

So  $v_{\cong}$  is onto homomorphism.

Proof is similar to [23].

### 5. Fuzzy $(m, n)$ -Semihyperring

Let  $\mathcal{R}$  be a non-empty set. Then

- 1) A fuzzy subset of  $\mathcal{R}$  is a function  $\mu : \mathcal{R} \rightarrow [0, 1]$ ;
- 2) For a fuzzy subset  $\mu$  of  $\mathcal{R}$  and  $t \in [0, 1]$ , the set  $\mu_t = \{x \in \mathcal{R} \mid \mu(x) \geq t\}$  is called the *level subset* of  $\mu$  [1,6,13,25].

**Definition 5.1** A fuzzy subset  $\mu$  of an  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  is called a *fuzzy  $(m, n)$ -sub-semihyperring* of  $\mathcal{H}$  if following hold true:

- 1)  $\min\{\mu(x_1), \mu(x_2), \dots, \mu(x_m)\} \leq \inf_{z \in f(x_1, x_2, \dots, x_m)} \mu(z)$ ,

for all  $x_1, x_2, \dots, x_m \in \mathcal{H}$

- 2)  $\min\{\mu(x_1), \mu(x_2), \dots, \mu(x_n)\} \leq \mu(g(x_1, x_2, \dots, x_n))$ ,

for all  $x_1, x_2, \dots, x_n \in \mathcal{H}$ .

**Definition 5.2** A fuzzy subset  $\mu$  of an  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  is called a *fuzzy hyperideal* of  $\mathcal{H}$  if the following hold true:

- 1)  $\min\{\mu(x_1), \mu(x_2), \dots, \mu(x_m)\} \leq \inf_{z \in f(x_1, x_2, \dots, x_m)} \mu(z)$ ,

for all  $x_1, x_2, \dots, x_m \in \mathcal{H}$ ,

- 2)  $\mu(x_1) \leq \mu(g(x_1, x_2, \dots, x_n))$ , for all  $x_1, x_2, \dots, x_n \in \mathcal{H}$ ,

- 3)  $\mu(x_2) \leq \mu(g(x_1, x_2, \dots, x_n))$ , for all  $x_1, x_2, \dots, x_n \in \mathcal{H}$ ,

⋮

- 4)  $\mu(x_n) \leq \mu(g(x_1, x_2, \dots, x_n))$ , for all  $x_1, x_2, \dots, x_n \in \mathcal{H}$ .

**Theorem 5.3** A fuzzy subset  $\mu$  of an  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  is a fuzzy hyperideal if and only if every non-empty level subset is a hyperideal of  $\mathcal{H}$ .

*Proof.* Suppose subset  $\mu$  is a fuzzy hyperideal of  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  and  $\mu_t$  is a level subset of  $\mu$ .

If  $x_1, x_2, \dots, x_m \in \mu_t$  for some  $t \in [0, 1]$  then from the definition of level set, we can deduce the following:

$$\mu(x_1) \geq t, \mu(x_2) \geq t, \dots, \mu(x_m) \geq t.$$

Thus, we say that:

$$\min\{\mu(x_1), \mu(x_2), \dots, \mu(x_m)\} \geq t$$

Thus:

$$\begin{aligned} & \inf_{z \in f(x_1, x_2, \dots, x_m)} \mu(z) \\ & \geq \min\{\mu(x_1), \mu(x_2), \dots, \mu(x_m)\} \geq t. \end{aligned} \tag{21}$$

So, we get the following:

$$\mu(z) \geq t, \text{ for all } z \in f(x_1, x_2, \dots, x_m).$$

Therefore,  $f(x_1, x_2, \dots, x_m) \subseteq \mu_t$ .

Again, suppose that  $x_1, x_2, \dots, x_n \in \mathcal{H}$  and  $x_i \in \mu_t$ , where  $1 \leq i \leq n$ . Then, we find that  $\mu(x_i) \geq t$ .

So, we obtain the following:

$$\begin{aligned} t \leq \mu_{x_i} &\leq \mu(g(x_1, x_2, \dots, x_n)) \\ &\rightarrow g(x_1^{i-1}, \mu_t, x_{i+1}^n) \subseteq \mu_t \end{aligned} \quad (22)$$

Thus, we find that  $\mu_t$  is a hyperideal of  $\mathcal{H}$ .

On the other hand, suppose that every non-empty level subset  $\mu_t$  is a hyperideal of  $\mathcal{H}$ .

Let  $t_0 = \min\{\mu_{x_1}, \mu_{x_2}, \dots, \mu_{x_n}\}$ , for all  $x_1, x_2, \dots, x_n \in \mathcal{H}$ .

Then, we obtain the following:

$$\mu(x_1) \geq t_0, \mu(x_2) \geq t_0, \dots, \mu(x_n) \geq t_0$$

Thus,

$$x_1, x_2, \dots, x_n \in \mu_{t_0}$$

We can also obtain that:

$$f(x_1, x_2, \dots, x_m) \subseteq \mu_{t_0}.$$

Thus,

$$\begin{aligned} &\min\{\mu(x_1), \mu(x_2), \dots, \mu(x_m)\} \\ &= t_0 \leq \inf_{z \in f(x_1, x_2, \dots, x_m)} \mu(z). \end{aligned} \quad (23)$$

Again, suppose that  $\mu(x_1) = t_1$ . Then  $x \in \mu_{t_1}$ .

So, we obtain:

$$g(x_1, x_2, \dots, x_n) \in \mu_{t_1} \rightarrow t_1 \leq \mu(g(x_1, x_2, \dots, x_n))$$

Thus,  $\mu(x_i) \leq \mu(g(x_1, x_2, \dots, x_n))$ .

Similarly, we obtain  $\mu(x_i) \leq \mu(g(x_1, x_2, \dots, x_n))$ , for all  $i \in \{1, n\}$ .

Thus, we can check all the conditions of the definition of fuzzy hyperideal.

This proof is a generalization of [1].

Theorem 5.3 is a generalization of [1, 11, 26].

Jun, Ozturk and Song [27] have proposed a similar theorem on hemiring.

**Theorem 5.4** Let  $\mathcal{I}$  be a non-empty subset of an  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$ . Let  $\mu_t$  be a fuzzy set defined as follows:

$$\mu_t(x) = \begin{cases} s & \text{if } x \in \mathcal{I}, \\ t & \text{otherwise,} \end{cases}$$

where  $0 \leq t < s \leq 1$ . Then  $\mu_t$  is a fuzzy left hyper ideal of  $\mathcal{H}$  if and only if  $\mathcal{I}$  is a left hyper ideal of  $\mathcal{H}$ .

Following Corollary 5.5 is generalization of [1].

**Corollary 5.5** Let  $\mu$  be a fuzzy set and its upper bound be  $t_0$  of an  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$ . Then the following are equivalent:

- 1)  $\mu$  is a fuzzy hyperideal of  $\mathcal{H}$ .
- 2) Every non-empty level subset of  $\mu$  is a hyperideal of  $\mathcal{H}$ .
- 3) Every level subset  $\mu_t$  is a hyperideal of  $\mathcal{H}$  where  $t \in [0, t_0]$ .

**Definition 5.6** Let  $(\mathcal{R}, f', g')$  and  $(\mathcal{S}, f'', g'')$  be fuzzy  $(m, n)$ -semihyperrings and  $\varphi$  be a map from  $\mathcal{R}$  into  $\mathcal{S}$ . Then  $\varphi$  is called homomorphism of fuzzy  $(m, n)$ -semihyperrings if following hold true:

$$\varphi(f'(x_1, x_2, \dots, x_m)) \leq f''(\varphi(x_1), \varphi(x_2), \dots, \varphi(x_m))$$

and

$$\varphi(g'(y_1, y_2, \dots, y_n)) \leq g''(\varphi(y_1), \varphi(y_2), \dots, \varphi(y_n))$$

for all  $x_1, x_2, \dots, x_m, y_1, y_2, \dots, y_n \in \mathcal{R}$ .

**Theorem 5.7** Let  $(\mathcal{R}, \mu_f, \mu_g)$  and  $(\mathcal{S}, \mu_{f'}, \mu_{g'})$  be two fuzzy  $(m, n)$ -semihyperrings and  $(\mathcal{R}, f', g')$  and  $(\mathcal{S}, f'', g'')$  be associated  $(m, n)$ -semihyperring. If  $\varphi: \mathcal{R} \rightarrow \mathcal{S}$  is a homomorphism of fuzzy  $(m, n)$ -semihyperrings, then  $\varphi$  is homomorphism of the associated  $(m, n)$ -semihyperrings also.

Definition 5.6 and Theorem 5.7 are similar to the one proposed by Leoreanu-Fotea [16] on fuzzy  $(m, n)$ -ary hyperrings and  $(m, n)$ -ary hyperrings and Ameri and Nozari [8] proposed a similar Definition and Theorem on hyperalgebras.

## 6. Conclusion

We proposed the definition, examples and properties of  $(m, n)$ -semihyperring.  $(m, n)$ -semihyperring has vast application in many of the computer science areas. It has application in cryptography, optimization theory, fuzzy computation, Bayesian networks and Automata theory, listed a few. In this paper we proposed Fuzzy  $(m, n)$ -semihyperring which can be applied in different areas of computer science like image processing, artificial intelligence, etc. We found some of the interesting results: the natural map from an  $(m, n)$ -semihyperring to the quotient of the  $(m, n)$ -semihyperring is an onto homomorphism. It is also found that if  $\rho$  and  $\sigma$  are two congruence relations on  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  such that  $\rho \subseteq \sigma$ , then  $\sigma/\rho$  is a congruence on  $\mathcal{H}/\rho$  and  $(\mathcal{H}/\rho)/(\sigma/\rho) \cong \mathcal{H}/\sigma$ . We found many interesting results in fuzzy  $(m, n)$ -semihyperring as well, like, a fuzzy subset  $\mu$  of an  $(m, n)$ -semihyperring  $(\mathcal{H}, f, g)$  is a fuzzy hyperideal if and only if every non-empty level subset is a hyperideal of  $\mathcal{H}$ . We can use  $(m, n)$ -semihyperring in cryptography in our future work.

## 7. Acknowledgements

The first author is indebted to Prof. Shrishra Rao of IIIT Bangalore for encouraging him to do research in this area. A few basic definitions were presented when the first

author was a master's student under the supervision of Prof. Shrisha Rao at IIIT Bangalore.
