## Abstract

We study the periodic solutions of the second-order differential equations of the form

$$\ddot{x} + 3x\dot{x} + x^3 + F(t)(\dot{x} + x^2) + G(t)x + H(t) = 0,$$

where the functions  $F(t)$ ,  $G(t)$  and  $H(t)$  are periodic of period  $2\pi$  in the variable  $t$ .

## Keywords

Periodic Solution, Differential Equation, Averaging Theory

---

## 1. Introduction and Statement of the Main Results

In this paper we shall study the existence of periodic solutions of the second-order differential equation of the form

$$\ddot{x} + 3x\dot{x} + x^3 + F(t)(\dot{x} + x^2) + G(t)x + H(t) = 0, \quad (1)$$

where the dot denotes derivative with respect to the time  $t$ , and the functions  $F(t)$ ,  $G(t)$  and  $H(t)$  are periodic of period  $2\pi$  in the variable  $t$ .

We note that the second-order differential Equation (1), when  $F = G = H = 0$ , appears in the Ince's catalog of equations possessing the Painlevé property (see [1]). Moreover, the differential equation  $\ddot{x} + 3x\dot{x} + x^3 = 0$  is well known in many areas of mathematics and physics, and it possesses the algebra  $\mathfrak{sl}(3, \mathbb{R})$  of Lie point symmetries (see for more details in the paper [2] and the references quoted there).

In a recent paper [3] (see also [4] [5]), the second-order differential Equation (1) has been studied when  $F = H = 0$ . A study of coupled quadratic unharmonic oscillators in terms of the Painlevé analysis and inte-

grability can be seen in [6], and studies on the second-order differential equations can be seen in [7]. Other approach to the periodic solutions of second-order differential equations can be found in [8].

Here we study the periodic solutions of the second-order differential Equation (1) when  $F(t) = \varepsilon f(t)$ ,  $G(t) = 1 + \varepsilon g(t)$ , and  $H(t) = \varepsilon^k h(t)$  with  $k = 1, 2$ . Our main results are the following ones.

**Theorem 1.** We define the functions

$$\begin{aligned} \mathcal{F}_1(X_0, Y_0) &= -\int_0^{2\pi} F(t, X_0, Y_0) \sin t dt, \\ \mathcal{F}_2(X_0, Y_0) &= \int_0^{2\pi} F(t, X_0, Y_0) \cos t dt, \end{aligned} \tag{2}$$

where

$$\begin{aligned} F(t, X_0, Y_0) &= -h(t) - g(t)A(t) - f(t)B(t) - 3A(t)B(t), \\ A(t) &= X_0 \cos t + Y_0 \sin t, \\ B(t) &= -X_0 \sin t + Y_0 \cos t. \end{aligned}$$

Assume that the functions  $F(t) = \varepsilon f(t)$ ,  $G(t) = 1 + \varepsilon g(t)$  and  $H(t) = \varepsilon^2 h(t)$  are  $2\pi$ -periodic. Then for  $\varepsilon \neq 0$  sufficiently small and for every  $(X_0^*, Y_0^*)$  solution of the system  $\mathcal{F}_j(X_0, Y_0) = 0$  for  $j = 1, 2$ , satisfy

$$\det \left( \frac{\partial (\mathcal{F}_1, \mathcal{F}_2)}{\partial (X_0, Y_0)} \right) \Big|_{(X_0, Y_0) = (X_0^*, Y_0^*)} \neq 0, \tag{3}$$

the differential Equation (1) has a  $2\pi$ -periodic solution  $x(t, \varepsilon) = \varepsilon (X_0^* \cos t + Y_0^* \sin t) + O(\varepsilon^2)$ .

Theorem 1 is proved in section 3 using the averaging theory described in section 2. Two applications of Theorem 1 are the following.

**Corollary 1.** We consider the differential Equation (1) with  $F(t) = \varepsilon(1 - \cos^2 t)$ ,  $G(t) = 1 + \varepsilon \sin^2 t$  and  $H(t) = \varepsilon^2 \sin t$ . Then for  $\varepsilon \neq 0$  sufficiently small, this differential equation has a  $2\pi$ -periodic solution  $x(t, \varepsilon) = \varepsilon 2(\sin t - \cos t)/3 + O(\varepsilon^2)$ .

**Corollary 2.** We consider the differential Equation (1) with  $F(t) = \varepsilon(1 - \cos^2 t + 2\cos^4 t)$ ,  $G(t) = 1 + \varepsilon(\sin^2 t + 2\sin^4 t)$  and  $H(t) = \varepsilon^2(\sin t + \sin^3 t)$ . Then for  $\varepsilon \neq 0$  sufficiently small, this differential equation has a  $2\pi$ -periodic solution  $x(t, \varepsilon) = \varepsilon(21\cos t - 7\sin t)/20 + O(\varepsilon^2)$ .

Corollaries 1 and 2 are also proved in section 3.

**Theorem 2.** Assuming that

$$\int_0^{2\pi} h(t) \sin t dt = 0, \quad \int_0^{2\pi} h(t) \cos t dt = 0,$$

and setting

$$\begin{aligned} \mathcal{F}_1(X_0, Y_0) &= -\int_0^{2\pi} f(t, X_0, Y_0) \sin t dt, \\ \mathcal{F}_2(X_0, Y_0) &= \int_0^{2\pi} f(t, X_0, Y_0) \cos t dt, \end{aligned} \tag{4}$$

with

$$\begin{aligned} f(t, X_0, Y_0) &= -g(t)A(t) - f(t)B(t) - 3A(t)B(t), \\ A(t) &= X_0 \cos t + Y_0 \sin t - \int_0^t h(\tau) \sin(t - \tau) d\tau, \\ B(t) &= -X_0 \sin t + Y_0 \cos t - \int_0^t h(\tau) \cos(t - \tau) d\tau. \end{aligned}$$

Assume that  $F(t) = \varepsilon f(t)$ ,  $G(t) = 1 + \varepsilon g(t)$  and  $H(t) = \varepsilon h(t)$  are  $2\pi$ -periodic functions. Then for  $\varepsilon \neq 0$  sufficiently small and for every  $(X_0^*, Y_0^*)$  solution of the system  $\mathcal{F}_j(X_0, Y_0) = 0$  for  $j = 1, 2$  satisfy (3), the differential Equation (1) has a periodic solution

$$x(t, \varepsilon) = \varepsilon \left( X_0^* \cos t + Y_0^* \sin t - \int_0^t h(\tau) \sin(t - \tau) d\tau \right) + O(\varepsilon^2).$$

Theorem 2 is proved in section 4. Two applications of Theorem 2 are the following.

**Corollary 3.** We consider the differential Equation (1) with  $F(t) = \varepsilon(\sin(2t) + \cos(2t))$ ,  $G(t) = 1 + \varepsilon \sin t$  and  $H(t) = \varepsilon 2 \cos^2 t$ . Then for  $\varepsilon \neq 0$  sufficiently small, this differential equation has a  $2\pi$ -periodic solution

$$x(t, \varepsilon) = \varepsilon \left( (-2 \cos t + 15 \sin t) / 31 + 2 \cos^2 t (\cos t - 1) \right) + O(\varepsilon^2).$$

**Corollary 4.** We consider the differential Equation (1) with  $F(t) = \varepsilon \sin t$ ,  $G(t) = 1 + \varepsilon \sin^2 t$  and  $H(t) = \varepsilon 2 \cos(2t)$ . Then for  $\varepsilon \neq 0$  sufficiently small, this differential equation has a periodic solution

$$x(t, \varepsilon) = \varepsilon \left( 2(\cos t - 1) \cos(2t) - \frac{8}{5} \sin t \right) + O(\varepsilon^2).$$

Corollaries 3 and 4 are also proved in section 4.

## 2. Basic Results on Averaging Theory

We state the results from the averaging method that we shall use for proving the results of this work.

We consider differential systems of the form

$$\mathbf{x}' = F_0(t, \mathbf{x}) + \varepsilon F_1(t, \mathbf{x}) + \varepsilon^2 F_2(t, \mathbf{x}, \varepsilon), \tag{5}$$

where  $\varepsilon$  is a small parameter, and the functions  $F_0, F_1 : \mathbb{R} \times \Omega \rightarrow \mathbb{R}^n$  and  $F_2 : \mathbb{R} \times \Omega \times (-\varepsilon_0, \varepsilon_0) \rightarrow \mathbb{R}^n$  are  $C^2$  functions,  $T$ -periodic in the variable  $t$ , and  $\Omega$  is an open subset of  $\mathbb{R}^n$ . Suppose that the unperturbed system

$$\mathbf{x}' = F_0(t, \mathbf{x}), \tag{6}$$

has a submanifold of dimension  $n$  of  $T$ -periodic solutions, i.e. of periodic solutions of period  $T$ .

We denote by  $\mathbf{x}(t, \mathbf{z}, 0)$  the solution of system (6) such that  $\mathbf{x}(0, \mathbf{z}, 0) = \mathbf{z}$ . We consider the first variational equation of system (6) on the periodic solution  $\mathbf{x}(t, \mathbf{z}, 0)$ , i.e.

$$\mathbf{y}' = D_x F_0(t, \mathbf{x}(t, \mathbf{z}, 0)) \mathbf{y}, \tag{7}$$

where  $\mathbf{y}$  is an  $n \times n$  matrix. Let  $M_z(t)$  the fundamental matrix of system (7) such that  $M_z(0)$  is the identity matrix of  $\mathbb{R}^n$ .

By assumption there exists an open set  $V$  such that  $\text{Cl}(V) \subset \Omega$  and for each  $\mathbf{z} \in \text{Cl}(V)$ ,  $\mathbf{x}(t, \mathbf{z}, 0)$  is  $T$ -periodic. Therefore we have the following result.

**Theorem 3.** We suppose that there is an open and bounded set  $V$  with  $\text{Cl}(V) \subset \Omega$  such that for each  $\mathbf{z} \in \text{Cl}(V)$ , the solution  $\mathbf{x}(t, \mathbf{z}, 0)$  is  $T$ -periodic, and let  $\mathcal{F} : \text{Cl}(V) \rightarrow \mathbb{R}^n$  be the function defined by

$$\mathcal{F}(\mathbf{z}) = \int_0^T M_z^{-1}(t) F_1(t, \mathbf{x}(t, \mathbf{z}, 0)) dt. \tag{8}$$

If there is  $\alpha \in V$  with  $\mathcal{F}(\alpha) = 0$  and  $\det((d\mathcal{F}/d\mathbf{z})(\alpha)) \neq 0$ , then there is a  $T$ -periodic solution  $\mathbf{x}(t, \varepsilon)$  of system (5) satisfying  $\mathbf{x}(t, \varepsilon) = \mathbf{x}(t, \mathbf{z}, 0) + O(\varepsilon)$ .

Theorem 3 is due to Malkin [9] and Roseau [10], for a new and shorter proof (see [11]).

## 3. Proof of Theorem 1 and Its Two Corollaries

*Proof of Theorem 1.* Introducing the variable  $y = \dot{x}$ , we can write the second-order differential Equation (1) as the following first-order differential system

$$\begin{aligned} \dot{x} &= y, \\ \dot{y} &= -3xy - x^3 - F(t)(y + x^2) - G(t)x - H(t). \end{aligned} \tag{9}$$

Doing the rescaling  $(x, y) = (\varepsilon X, \varepsilon Y)$ , we obtain the system

$$\begin{aligned}\dot{X} &= Y \\ \dot{Y} &= -X + \varepsilon(-h(t) - g(t)X - f(t)Y - 3XY) + \varepsilon^2(-f(t)X^2 - X^3).\end{aligned}\tag{10}$$

System (10) with  $\varepsilon = 0$  is the unperturbed system, otherwise system (10) is the perturbed system. The unperturbed system has a unique singular point, the origin of coordinates. The solution  $(X(t), Y(t))$  of the unperturbed system such that  $(X(0), Y(0)) = (X_0, Y_0)$  is

$$X(t) = X_0 \cos t + Y_0 \sin t, \quad Y(t) = -X_0 \sin t + Y_0 \cos t.$$

Note that all these periodic orbits have period  $2\pi$ . Using the notation introduced in section 2. We have that  $\mathbf{x} = (X, Y)$ ,  $\mathbf{z} = (X_0, Y_0)$ ,  $F_0(\mathbf{x}, t) = (Y, -X)$ ,  $F_1(\mathbf{x}, t) = (0, -h(t) - g(t)X - f(t)Y - 3XY)$  and  $F_2(\mathbf{x}, t) = (0, -f(t)X^2 - X^3)$ .

The fundamental matrix solution  $M_z(t)$  is independent of the initial condition  $\mathbf{z}$ , and denoting it by  $M(t)$  we obtain

$$M(t) = \begin{pmatrix} \cos t & \sin t \\ -\sin t & \cos t \end{pmatrix}.$$

Now we compute the function  $\mathcal{F}(\mathbf{z}) = (\mathcal{F}_1(X_0, Y_0), \mathcal{F}_2(X_0, Y_0))$  given in (8), and we get the functions (2) of the statement of Theorem 1.

By Theorem 3 each zero  $(X_0^*, Y_0^*)$  of system  $\mathcal{F}_1(X_0, Y_0) = \mathcal{F}_2(X_0, Y_0) = 0$  satisfying (3), provides a  $2\pi$ -periodic solution  $(X(t, \varepsilon), Y(t, \varepsilon))$  of system (10) with  $\varepsilon \neq 0$  sufficiently small such that

$$(X(t, \varepsilon), Y(t, \varepsilon)) = (X_0^* \cos t + Y_0^* \sin t, -X_0^* \sin t + Y_0^* \cos t) + O(\varepsilon).$$

Going back through the change of variables for every periodic solution  $(X(t, \varepsilon), Y(t, \varepsilon))$  of system (10) with  $\varepsilon \neq 0$  sufficiently small, we obtain a  $2\pi$ -periodic solution  $x(t, \varepsilon) = \varepsilon(X_0^* \cos t + Y_0^* \sin t) + O(\varepsilon^2)$  of the differential Equation (1) with  $\varepsilon \neq 0$  sufficiently small. This completes the proof of Theorem 1.  $\square$

*Proof of Corollary 1.* We must apply Theorem 1 with

$$f(t) = 1 - \cos^2 t, \quad g(t) = \sin^2 t, \quad h(t) = \sin t.$$

We compute the functions  $\mathcal{F}_1$  and  $\mathcal{F}_2$  of the statement of Theorem 1, and we obtain

$$\mathcal{F}_1(X_0, Y_0) = \frac{\pi}{4}(4 - 3X_0 + 3Y_0), \quad \mathcal{F}_2(X_0, Y_0) = \frac{\pi}{4}(-X_0 - Y_0).$$

System  $\mathcal{F}_1 = \mathcal{F}_2 = 0$  has the zero  $(X_0^*, Y_0^*) = (2/3, -2/3)$ . Since the Jacobian (3) at this zero is  $3\pi^2/8$ , we obtain using Theorem 1 the periodic solution given in the statement of the corollary.  $\square$

*Proof of Corollary 2.* We apply Theorem 1 with

$$f(t) = 1 - \cos^2 t + 2\cos^4 t, \quad g(t) = \sin^2 t + 2\sin^4 t, \quad h(t) = \sin t + \sin^3 t.$$

Computing the functions  $\mathcal{F}_1$  and  $\mathcal{F}_2$  of Theorem 1 we get

$$\mathcal{F}_1(X_0, Y_0) = \frac{\pi}{4}(7 - 4X_0 + 8Y_0), \quad \mathcal{F}_2(X_0, Y_0) = -\frac{\pi}{2}(X_0 + 3Y_0).$$

System  $\mathcal{F}_1 = \mathcal{F}_2 = 0$  has the zero  $(X_0^*, Y_0^*) = (21/20, -7/20)$ . Since the Jacobian (3) at this zero is  $5\pi^2/2$  the corollary follows.  $\square$

#### 4. Proof of Theorem 2 and Its Corollaries

*Proof of Theorem 2.* As in the proof of Theorem 1, the second-order differential Equation (1) can be written as the first order differential system (9). Doing the rescaling  $(x, y) = (\varepsilon X, \varepsilon Y)$ , we obtain the system

$$\begin{aligned}\dot{X} &= Y \\ \dot{y} &= -X - h(t) + \varepsilon(-g(t)X - f(t)Y - 3XY) + \varepsilon^2(-f(t)X^2 - X^3).\end{aligned}\tag{11}$$

System (11) with  $\varepsilon = 0$  is the unperturbed system, otherwise it is the perturbed system. The solution  $(X(t), Y(t))$  of the unperturbed system such that  $(X(0), Y(0)) = (X_0, Y_0)$  is

$$\begin{aligned} X(t) &= X_0 \cos t + Y_0 \sin t - \int_0^t h(\tau) \sin(t - \tau) d\tau, \\ Y(t) &= -X_0 \sin t + Y_0 \cos t - \int_0^t h(\tau) \cos(t - \tau) d\tau. \end{aligned}$$

Note that these periodic orbits have period  $2\pi$ . Using the notation introduced in section 2. We have that  $\mathbf{x} = (X, Y)$ ,  $\mathbf{z} = (X_0, Y_0)$ ,  $F_0(\mathbf{x}, t) = (Y, -X - h)$ ,  $F_1(\mathbf{x}, t) = (0, -g(t)X - f(t)Y - 3XY)$  and  $F_2(\mathbf{x}, t) = (0, -f(t)X^2 - X^3)$ .

The fundamental matrix solution  $M_z(t)$  is independent of the initial condition  $\mathbf{z}$  and it is

$$M(t) = \begin{pmatrix} \cos t & \sin t \\ -\sin t & \cos t \end{pmatrix}.$$

We compute the function  $\mathcal{F}(\mathbf{z}) = (\mathcal{F}_1(X_0, Y_0), \mathcal{F}_2(X_0, Y_0))$  given in (8), and we get the functions (4) of the statement of Theorem 2.

By Theorem 3, each zero  $(X_0^*, Y_0^*)$  of system  $\mathcal{F}_1(X_0, Y_0) = \mathcal{F}_2(X_0, Y_0) = 0$  satisfying (3), provides a  $2\pi$ -periodic solution  $(X(t, \varepsilon), Y(t, \varepsilon))$  of system (11) with  $\varepsilon \neq 0$  sufficiently small such that

$$\begin{pmatrix} X(t, \varepsilon) \\ Y(t, \varepsilon) \end{pmatrix} = \begin{pmatrix} X_0^* \cos t + Y_0^* \sin t - \int_0^t h(\tau) \sin(t - \tau) d\tau \\ -X_0^* \sin t + Y_0^* \cos t - \int_0^t h(\tau) \cos(t - \tau) d\tau \end{pmatrix} + O(\varepsilon).$$

Going back through the change of variables for every periodic solution  $(X(t, \varepsilon), Y(t, \varepsilon))$  of system (11) with  $\varepsilon \neq 0$  sufficiently small, we obtain a  $2\pi$ -periodic solution

$$x(t, \varepsilon) = \varepsilon \left( X_0^* \cos t + Y_0^* \sin t - \int_0^t h(\tau) \sin(t - \tau) d\tau \right) + O(\varepsilon^2)$$

of the differential Equation (1) for  $\varepsilon \neq 0$  sufficiently small. This completes the proof of Theorem 2. □

*Proof of Corollary 3.* We apply Theorem 2 with

$$f(t) = \sin(2t) + \cos(2t), \quad g(t) = \sin t, \quad h(t) = 2\cos^2 t.$$

We compute the functions  $\mathcal{F}_1$  and  $\mathcal{F}_2$  of the statement of Theorem 2, and we obtain

$$\mathcal{F}_1(X_0, Y_0) = \frac{\pi}{2}(2 + X_0 - 4Y_0), \quad \mathcal{F}_2(X_0, Y_0) = \frac{\pi}{2}(1 + 8X_0 - Y_0).$$

System  $\mathcal{F}_1 = \mathcal{F}_2 = 0$  has the solution  $(X_0^*, Y_0^*) = (-2/31, 15/31)$ . Since the Jacobian (3) is  $31\pi^2/4$ , by Theorem 2 we obtain the periodic solution of the statement of the corollary. □

*Proof of Corollary 4.* We apply Theorem 2 with

$$f(t) = \sin t, \quad g(t) = \sin^2 t, \quad h(t) = 2\cos(2t).$$

We compute the functions  $\mathcal{F}_1$  and  $\mathcal{F}_2$  of the statement of Theorem 2, and we obtain

$$\mathcal{F}_1(X_0, Y_0) = \frac{3\pi}{4}(8 + 5Y_0), \quad \mathcal{F}_2(X_0, Y_0) = \frac{11\pi}{4}X_0.$$

System  $\mathcal{F}_1 = \mathcal{F}_2 = 0$  has the solution  $(X_0^*, Y_0^*) = (0, -8/5)$ . Since the Jacobian (3) is  $-165\pi^2/16$ , by Theorem 2 we obtain the periodic solution of the statement of the corollary. □
