Abstract

CN-85 detector which covered with boric acid H_3Bo_3 pellete has been irradiated by thermal neutrons from ($^{241}Am-^9Be$) source with activity 12 Ci and neutron flux 10^5 n. cm^{-2} . s^{-1} . The irradiation times- T_D for detector were 4 h, 8 h, 16 h and 24 h. The track detector has been etched with sodium hydroxide. After chemical etching of the irradiated CN-85 detector, the images have been taken from a digital camera connected to the optical microscope. Image processing for the output images has been performed using MATALB program, and these images were analyzed and we had found the following relations: a) The relation between summation of opened track or surface density for tracks (intensity- I_T) varies with radius of opening (track radius- R_T). b) The relation between the tracks number- N_T varies with the tracks diameter- D_T (in micrometer) and tracks area- A_T . That analysis of image processing was obtained, and the track intensity- I_T was decreased with increase of track radius- R_T at all of the irradiation time- T_D . And the track intensity- I_T was increased with increasing irradiation time- T_D (h) for different track radius- R_T (0.4225, 0.845, 1.2675 and 1.69 μm). The study indicates the possibility of using the analysis of image processing to CN-85 detector for classification of α -particle emitters through limitation of radius of track- R_T , in addition to the contribution of these techniques in preparation of nano-filters and nono-membrane in nanotechnology fields.

1. Introduction

Cellulose nitrate detector is one of organic nuclear track detectors [1] and common type of cellulose nitrate is CN-85 detector. And this detector contains in chemical composition on nitrogen which has a chemical structure $C_6H_{18}O_5N_2$. CN-85 detector is one of the good detectors for the detection of neutrons and charged particles such as protons, α -particles, fission fragments and heavy ions [2]-[4]. There are a number of programs that are used in image processing for digital images. One of these programs is MATLAB, which used the image processing in many application fields [5]-[9]. Image analysis for nuclear track detectors-NTDs was one of these applications.

In 2006 Patiris, D. L. *et al.* [10] used a computer program named TRIAC written in MATLAB which has been developed for track recognition and track parameters measurements from images of the solid state nuclear track detectors type CR-39. The program using image analysis tools counts the number of tracks for dosimetry proposes and classifies the tracks according to their radii for the spectrometry of alpha-particles as using same computer program named TRIAC II has been developed for recognition and parameters measurements of particles "tracks" from images of solid state nuclear track detectors. In Fuminobu Sato *et al.* (2007) [11] observation system was developed to record time-lapse images of etch pits formed on the surface of a solid-state nuclear track detector-SSNTD type CR-39.

After that in 2008 Mostofizadeh, A. *et al.* [12], used MATLAB program as method to study edge detection, all measurements carried out in two cases of before and after improvement of track images. Considering the overlapping phenomenon—including double and triple tracks—experimental and statistical results showed that not only each particular edge detection method affects the accuracy of measurements. The tracks were randomly seeded on the film to simulate the irradiation by alpha particles emitted by the naturally occurring radon gas and its short-lived progeny. The ray-tracing method was applied to simulate light propagation through the tracks. The total amount of scattering increased linearly with the track density and quadratic ally with the removed layer during chemical etching of the irradiated CR-39 detector.

In 2013 Osinga, J.M. *et al.* [13] used $Al_2O_3:C$, Mg-based fluorescent nuclear track detectors-FNTDs and confocal laser scanning microscopy as a semiautomatic tool for fluence measurements in clinical ion beams. Then Firas M. Al-Jomaily, *et al.* [14], used MATLAB program to determine the nuclear track parameters such as track diameter- D_T (μm), number of track- N_T and track area- A_T for LR-115 detector which irradiated by alpha particle. In this study, the nuclear track parameters will be analyzed for CN-85 detector which is calculated by MATLAB program with the irradiation time- T_D , and its relationship with track diameter- D_T (μm).

2. Material and Methods

Solid state nuclear track detector SSNTDs-type CN-85 was manufactured by Kodak-Pathe, France. CN-85 detector was in the form of sheets with thickness 0.1 mm. These sheets were cut into four pieces with dimensions 1 cm \times 1 cm. And the species covered with boric acid- H_3BO_3 pellets which propagate by pressed 0.5 g of H_3BO_3 in piston for 30 s under pressure 150 par. The dimensions of steel piston mould were 1 mm thickness and 2 cm diameter. CN-85 detectors covered with pellets of boric acid- H_3BO_3 to convert free thermal neutrons to α -particle through $^{10}B(n, \alpha)^7Li$ interaction [15] (Figure 1(b)). The samples of CN-85 detectors and boric acid pellets were putted around the paraffin wax as shown in (Figure 1(a)).

The source of thermal neutron was ^{241}Am - 9Be with activity 12 Ci, neutron flux 10^5 n. cm^{-2} . s^{-1} , with 5 cm distance between the source and samples. The irradiation times- T_D of thermal neutrons were 4 h, 8 h, 16 h and 24 h. After samples irradiated, the boric acid pellets has been removed taken from CN-85 detectors. Chemical etching process for CN-85 has been done by using sodium hydroxide NaOH solution with 2.5 N at etching time; 15 min and temperature; 50°C. The counting of chemically etched tracks was carried out using optical microscope (type Motic, Malaysia). It is capable of giving magnifications of 400 \times and eyepiece 10 \times to measure the number of tracks. The type of eye piece was scalar to calculate the number of tracks. The optical microscope was connected with digital camera which has 1.3 Mega pixel and high resolution USB 2.0 with color digital image system. Image processing for output images have been performed using MATLAB program version R2013b (8.2.0.701) for 64 bit (win 64). Take images for detectors which contain on the nuclear tracks and store these images (pixel unit) in computer at the form (jpg. file). One pixel in these image was equal to converting factor 0.4225 μm which calculated experimentally by using of role scale in optical microscope and take into account in the input program of MATLAB image processing.

Figure 2. Images by optical microscope of CN-85 detector irradiated with thermalneutrons for different times (un-irradiated, 4 h, 8 h, 16 h and 24 h).

3. Results and Discussion

Figure 2 shows the nuclear track detector CN-85 irradiation by thermal neutron at different time 4 h, 8 h, 16 h, and 24 h. From this figure show increasing in the tracks with increasing of irradiation time compare with non-irradiated detector.

Figure 3(a) shows the first step from image processing of MATLAB program for the image of tracks in CN-85 detector after irradiation time 24 h by thermal neutron before image analysis.

While, **Figure 3(b)** shows same image after treatment the background of unwanted impurities and distortions on the detector.

Figure 4 shows the second step in image processing and shows the real image for tracks which convert from **(Figure 3(b))** to binary system.

Figure 5 shows the third step in image processing by determination the relationship between the pixel value summation of opened track or surface density for tracks (I_T) with radius of opening of track- R_T (in pixel). And obtained the radius of opening of track was increase when the surface density for track decreases.

Figure 3. First step from image processing of MATLAB program which obtained the track image in CN-85 detector after 24 h irradiated time by thermal neutrons. (a) Before image processing; (b) After image processing.

Figure 4. Second step from image processing of MATLAB program which obtained from converting to binary system in CN-85 detector after 24 h irradiated time.

The fourth step in **Figure 6** appears pseudo coloring map for tracks of CN-85 detector. The color type of track dependent on the diameter or track area- A_T .

Figure 7 displays the relationship between the number of tracks- N_T and diameter of track- D_T which represent as the fifth step from image processing. From this figure obtained the maximum diameter- D_T appear in following track diameter- D_T (3.66, 1.93, 2.53 and 4.8 μm).

The final step for relationship between the tracks number- N_T and of track area- A_T was obtained in **Figure 8**. From this figure show the maximum of track number- N_T appear at the track area- A_T with value 21.4 μm^2 .

Figure 9 shows comparison for the relations between track intensity- I_T for CN-85 with track radius- R_T for different irradiation time- T_D , which show there was decrease in track intensity- I_T with increase of track radius- R_T .

From **Figure 9**, the track intensity- I_T was decrease with increase of track radius- R_T at all of the irradiation time- T_D until to track radius- R_T ; 2.11 μm at all irradiation time- T_D . Where **Figure 10**, shows linearly relationship between track intensity- I_T and irradiation time- T_D at different track radius- R_T (0.4225, 0.845, 1.2675 and 1.69 μm) which calculate from **Figure 9**.

Figure 5. Third step from image processing of MATLAB program which obtained value summation of opened track or surface density for tracks (intensity- I_T , in pixel) varies with radius of opening (track radius- R_T , in pixel) for irradiated CN-85 detector at time 24 h.

Figure 6. Fourth step from image processing of MATLAB program which appear pseudo coloring map for tracks of CN-85 detector.

Figure 7. Fifth step from image processing of MATLAB program which obtained the histogram between the tracks number- N_T (NO.) and the tracks diameter- D_T (Diameter; micrometer) for irradiated CN-85 detector at 24 h.

Figure 8. Six step from image processing of MATLAB program which obtained the histogram between the tracks number- N_T (NO.) and the tracks area- A_T (Area) for irradiated CN-85 detector at 24 h.

Figure 9. Relation between track intensity- I_T (pixel) for CN-85 with track radius- R_T at different irradiation time- T_D for 4 h, 8 h, 16 h and 24 h.

Figure 10. Relation between track intensity- I_T for CN-85 with irradiation time- T_D (h) for different radius of track- R_T (0.4225, 0.845, 1.2675, 1.69 and 2.11 μm).

From **Figure 10**, shows the track intensity- I_T was increase with increase of irradiation time- T_D for all track radius- R_T , and the maximum response was at track radius- R_T value 0.4225 μm .

4. Conclusion

The analysis, which is obtained by image processing technique of MATLAB program for CN-85 detector, can be determined for other nuclear track detectors, and also for other particle radiations. The behavior which calculated from this study for track radius- R_T with irradiation time- T_D can be used to obtain the amount of energy for α -particle and determine the type of α -particle emitters. The image analyses, which are determined by MATLAB program for the CN-85 detector, specialized nuclear track radius- R_T , can be used in the nanotechnology studies. Where the preparation of nano filters and nano membrane from NTDs depends on the nuclear track radius- R_T [16] as the indicator to reach of the requirements specifications.
