## ABSTRACT

A simple approach to the formation of a Hamiltonian matrix for some Schrödinger equations describing the molecules with large amplitude motions has been proposed. The algorithm involving one or several variables has been concretely defined for the basis functions represented by Fourier series and orthogonal polynomials, taking Hermitian polynomials as an example.

**Keywords:** Schrödinger Equation; Large Amplitude Motions; Hamiltonian Matrix

## 1. Introduction

Algebraic approaches to solving of Schrödinger equations have several advantages compared to other methods. Provided the basis functions used for expansion of the wave functions and the potential energy of a system are adequately selected, the Schrödinger equation takes the matrix form, in the end its solution being reduced to the derivation of eigenfunctions and eigenvalues for the Hamiltonian matrix. When studying the molecules whose variables are changing with a large amplitude, the Hamiltonian matrix derivation is a nontrivial problem. This work presents an algorithm to form the Hamiltonian matrix for some Schrödinger equations describing molecules and molecular systems with several variables of this type. Such equations may be illustrated by the following:

$$-F \frac{d^2\Psi}{d\varphi^2} + U(\varphi) = E\Psi \quad (1)$$

$$-A \frac{\partial^2\Psi(s,t)}{\partial s^2} - B \frac{\partial^2\Psi(s,t)}{\partial t^2} + U(s,t)\Psi(s,t) = E\Psi(s,t) \quad (2)$$

$$-F \left( \frac{\partial^2\Psi(x,y,z)}{\partial x^2} + \frac{\partial^2\Psi(x,y,z)}{\partial y^2} + \frac{\partial^2\Psi(x,y,z)}{\partial z^2} \right) + U(x,y,z)\Psi(x,y,z) = E\Psi(x,y,z) \quad (3)$$

In all cases it is assumed that with a change in the vari-

ables the kinematic parameters remain invariable. This may be attained by an adequate selection of a coordinate system strongly related to the molecule, both in the case of symmetric [1-4] and low-symmetry [5-9] molecules. Equation (1), in particular, describes internal vibrations in a molecule of methanol, taking the effective vibrational constant as  $F$  [10-12]. In some cases an invariable character of the molecular kinematic parameters for large amplitude motions may be considered as a physically valid approximation. Specifically, Equation (3) may be used for the description of motion of a hydrogen atom in the process of hydrogen bonding if we neglect motion of the oxygen atoms, the amplitude of which is in fact considerably smaller than that of  $H$  motion as a mass ratio of these atoms is 1:16. This paper presents “quick” approaches to construct the Hamiltonian matrix for some basis functions.

## 2. Using of Fourier Series

Since the use of Fourier series for solving of equations of the form given in (1) is frequently described in the literature and in some works the formation algorithm for the Hamiltonian matrix is given in detail, we begin our analysis from Equation (2). Let the potential energy be given in the form:

$$U(s,t) = \sum_{k,l=-a,-b}^{a,b} u_{kl} e^{i(ks+lt)}; \quad a, b \in \mathbb{N} \quad (4)$$

Then a wave function is derived as:

$$\Psi(s, t) = \sum_{n, m=-\infty}^{\infty} b_{nm} e^{i(ns+mt)} \tag{5}$$

Substituting (4) and (5) into (2), we obtain:

$$\sum_{n, m=-\infty}^{\infty} (n^2 A + m^2 B - E) b_{nm} e^{i(ns+mt)} + \sum_{n, m=-\infty}^{\infty} \sum_{k, l=-a, -b}^{a, b} u_{kl} b_{nm} e^{i((n+k)s+(m+l)t)} = 0 \tag{6}$$

Next we define coefficients for the exponential  $e^{i(n's+m't)}$ . In the second term the following condition must be fulfilled:

$$\begin{aligned} n+k=n' &\Rightarrow k=n'-n; \\ m+l=m' &\Rightarrow l=m'-m \end{aligned} \tag{7}$$

Instead of (6), we have:

$$\begin{aligned} &(n'^2 A + m'^2 B - E) b_{n'm'} e^{i(n's+m't)} \\ &+ \sum_{n, m=-\infty}^{\infty} \sum_{n'-n, m'-m=-a, -b}^{a, b} u_{n'-n, m'-m} b_{nm} e^{i(n's+m't)} = 0 \end{aligned} \tag{8}$$

Then we construct the finite matrix with the dimensions  $(2c+1)^2 \times (2c+1)^2$ ;  $c \in N$ . This means that  $n$  and  $m$  are varying within the limits from  $-c$  to  $c$  per unity. From (8) we derive:

$$\begin{aligned} &(n'^2 A + m'^2 B - E) b_{n'm'} e^{i(n's+m't)} \\ &+ \sum_{n, m=-c}^c \sum_{n'-n, m'-m=-a, -b}^{a, b} u_{n'-n, m'-m} b_{nm} e^{i(n's+m't)} = 0 \end{aligned} \tag{9}$$

Now we take (9) as a matrix equation of the form  $H_{ij} \|b_j\| = E_j \|b_j\|$ , where  $\|b_j\|$ —column vector that, according to (5), gives the wave function corresponding to the energy  $E_j$ . It is clear that a pair of the indices  $(n', m')$  numbers rows of the Hamiltonian matrix and a pair of the indices  $(n, m)$ —its columns. Next, to derive the Hamiltonian matrix from (9), first we have to fix an order of the coefficients  $b_{nm}$  in the column vector of the wave function defined by Equation (5). For example, if  $c = 1$ , the transposed column vector may be of the form:

$A+B+u_{00}$	$u_{0,-1}$	0	$u_{-1,0}$	$u_{-1,-1}$	0	0	0	0
$u_{0,1}$	$A+u_{00}$	$u_{0,-1}$	$u_{-1,1}$	$u_{-1,0}$	$u_{-1,-1}$	0	0	0
0	$u_{0,1}$	$A+B+u_{00}$	0	$u_{-1,1}$	$u_{-1,0}$	0	0	0
$u_{1,0}$	$u_{1,-1}$	0	$B+u_{00}$	$u_{0,-1}$	0	$u_{-1,0}$	$u_{-1,-1}$	0
$u_{1,1}$	$u_{1,0}$	$u_{1,-1}$	$u_{0,1}$	$u_{00}$	$u_{0,-1}$	$u_{-1,1}$	$u_{-1,0}$	$u_{-1,-1}$
0	$u_{1,1}$	$u_{1,0}$	0	$u_{0,1}$	$B+u_{00}$	0	$u_{-1,1}$	$u_{-1,0}$
0	0	0	$u_{1,0}$	$u_{1,-1}$	0	$A+B+u_{00}$	$u_{0,-1}$	0
0	0	0	$u_{1,1}$	$u_{1,0}$	$u_{1,-1}$	$u_{0,1}$	$A+u_{00}$	$u_{0,-1}$
0	0	0	0	$u_{1,1}$	$u_{1,0}$	0	$u_{0,1}$	$A+B+u_{00}$

Next we consider the case of three variables. Let the

$$\|\tilde{b}\| = \langle b_{-1,-1}; b_{-1,0}; b_{-1,1}; b_{0,-1}; b_{0,0}; b_{0,1}; b_{1,-1}; b_{1,0}; b_{1,1} \rangle \tag{10}$$

Let us assume that in the same order from top to bottom there is a change in the index pair  $(n', m')$  numbering rows of the Hamiltonian matrix. Then a matrix element of  $H$  is numbered by two index pairs,  $H_{(n', m'), (n, m)}$ . Considering that usually  $c \gg a, b$ , for the diagonal element  $(n = n'; m = m')$  we can write:

$$H_{(n', m'), (n, m')} = n'^2 A + m'^2 B + u_{00} - E \tag{11}$$

and for nondiagonal elements we can write:

$$H_{(n', m'), (n, m)} = u_{n'-n, m'-m} \tag{12}$$

$$\text{if } |n'-n| \leq a \text{ and } |m'-m| \leq b$$

$$H_{(n', m'), (n, m)} = 0 \tag{13}$$

$$\text{if } |n'-n| > a \text{ or } |m'-m| > b$$

Numbering matrix elements of  $H$  by the ordinary indices  $(i, j)$  each of which is varying from 1 to  $(2c+1)^2$ , we should establish for each of them a one-to-one correspondence to a pair of numbers by the principle:  $i \Leftrightarrow (n'_i, m'_i)$ ;  $j \Leftrightarrow (n_j, m_j)$ . Specifically, in the case given by (10) for  $i = 3$  we have  $n'_3 = -1$ ;  $m'_3 = 1$ ; and for  $j = 6$  we have  $n_6 = 0$ ;  $m_6 = 1$ . Now an algorithm for the formation of the matrix  $H$  takes the following form:

$$H_{ii} = n_i'^2 A + m_i'^2 B + u_{00} - E \tag{14}$$

$$H_{ij} = u_{n'_i-n_j, m'_i-m_j} \tag{15}$$

$$\text{if } |n'_i-n_j| \leq a \text{ and } |m'_i-m_j| \leq b$$

$$H_{ij} = 0 \text{ if } |n'_i-n_j| > a \text{ or } |m'_i-m_j| > b \tag{16}$$

Let us write the Hamiltonian matrix in the explicit form with the use of (14 - 16) for  $c = 1$ . Besides, we assume that the index order is determined by the relation of (10), and  $a = b = 1$ . Then we have:

Schrödinger equation be of the form:

$$-A \frac{\partial^2 \Psi(s, t, r)}{\partial s^2} - B \frac{\partial^2 \Psi(s, t, r)}{\partial t^2} - C \frac{\partial^2 \Psi(s, t, r)}{\partial r^2} + U(s, t, r) \Psi(s, t, r) = E \Psi(s, t, r) \quad (17)$$

Then we define an algorithm to form the Hamiltonian matrix when using three-dimensional Fourier series. Let the potential energy be given as:

$$U(s, t, r) = \sum_{h,k,l=-a,-b,-c}^{a,b,c} u_{hkl} e^{i(hs+kt+lr)}, \quad (18)$$

$a, b, c \in N$

A wave function takes the form:

$$\Psi(s, t, r) = \sum_{n,m,q=-\infty}^{\infty} b_{nmq} e^{i(ns+mt+qr)} \quad (19)$$

Substituting (18) and (19) into (17), we obtain:

$$\sum_{n,m,q=-\infty}^{\infty} (n^2 A + m^2 B + q^2 C - E) b_{nmq} e^{i(ns+mt+qr)} + \sum_{n,m,q=-\infty}^{\infty} \sum_{h,k,l=-a,-b,-c}^{a,b,c} u_{hkl} b_{nmq} e^{i((n+h)s+(m+k)t+(l+q)r)} = 0 \quad (20)$$

Let us find coefficients for the exponential  $e^{i(n's+m't+q'r)}$ . The following condition must be fulfilled:

$$\begin{aligned} n+h &= n' \Rightarrow h = n' - n; \\ m+k &= m' \Rightarrow k = m' - m; \\ l+q &= l' \Rightarrow q = l' - l; \end{aligned} \quad (21)$$

Instead of (20), we have:

$$(n'^2 A + m'^2 B + q'^2 C - E) b_{n'm'q'} e^{i(n's+m't+q'r)} + \sum_{n,m,q=-\infty}^{\infty} \sum_{h,k,l=-a,-b,-c}^{a,b,c} u_{n'-n,m'-m,l'-l} b_{nmq} e^{i(n's+m't+q'r)} = 0 \quad (22)$$

We construct the finite matrix with the dimensions  $(2d+1)^3 \times (2d+1)^3$ ;  $d \in N$ , i.e.  $n, m$ , and  $q$  are varying within the limits from  $-d$  to  $d$  per unity. From Equation (22) we get:

$$(n'^2 A + m'^2 B + q'^2 C - E) b_{n'm'q'} e^{i(n's+m't+q'r)} + \sum_{n,m,q=-d}^d \sum_{h,k,l=-a,-b,-c}^{a,b,c} u_{n'-n,m'-m,l'-l} b_{nmq} e^{i(n's+m't+q'r)} = 0 \quad (23)$$

Now three indices  $(n', m', l')$  number rows and three indices  $(n, m, l)$  number columns of the Hamiltonian matrix. To derive a Hamiltonian matrix from (23), we again fix an order of the coefficients  $b_{nmq}$  in the column vector for the wave function defined by (19). For example, if  $c = 1$ , the transposed column vector may be of the form:

$$\begin{aligned} \|\tilde{b}\| = & \langle b_{-1,-1,-1}; b_{-1,-1,0}; b_{-1,-1,1}; b_{-1,0,-1}; b_{-1,0,0}; \\ & b_{-1,0,1}; b_{-1,1,-1}; b_{-1,1,0}; b_{-1,1,1}; b_{0,-1,-1}; b_{0,-1,0}; \\ & b_{0,-1,1}; b_{0,0,-1}; b_{0,0,0}; b_{0,0,1}; b_{0,1,-1}; b_{0,1,0}; b_{0,1,1}; \\ & b_{1,-1,-1}; b_{1,-1,0}; b_{1,-1,1}; b_{1,0,-1}; b_{1,0,0}; b_{1,0,1}; \\ & b_{1,1,-1}; b_{1,1,0}; b_{1,1,1} \rangle \end{aligned} \quad (24)$$

We assume that a change of three indices  $n', m', q'$ , numbering rows for the Hamiltonian matrix is in the same order from top to bottom. Then a matrix element of  $H$  is numbered by two pairs of three indices,  $H_{(n',m',q'),(n,m,q)}$ . Considering that, as previously, we have  $d \gg a, b, c$ , then for the diagonal elements ( $n = n'; m = m'; q = q'$ ) we can write:

$$H_{(n',m',q'),(n',m',q')} = n'^2 A + m'^2 B + q'^2 C + u_{000} - E \quad (25)$$

And for nondiagonal elements we can write:

$$H_{(n',m',q'),(n,m,q)} = u_{n'-n,m'-m,q'-q} \quad (26)$$

if  $|n' - n| \leq a; |m' - m| \leq b$  and  $|q' - q| \leq c$

$$H_{(n',m',q'),(n,m,q)} = 0 \text{ if } |n' - n| > a \quad (27)$$

or  $|m' - m| > b$  or  $|q' - q| > c$

when numbering the matrix elements of  $H$  by the ordinary indices  $(i, j)$  each of which is varying from 1 to  $(2c+1)^3$ , we should establish for each of them a one-to-one correspondence to three numbers by the principle:  $i \Leftrightarrow (n'_i, m'_i, q'_i); j \Leftrightarrow (n_j, m_j, q_j)$ . Specifically, in the case given by (24) for  $i = 3$  we have  $n'_3 = -1; m'_3 = -1; q'_3 = 1$ , and for  $j = 19$  we have  $n_{19} = 1; m_{19} = -1; q_{19} = -1$ . Now an algorithm to form the matrix  $H$  takes the form:

$$H_{ii} = n_i'^2 A + m_i'^2 B + q_i'^2 C + u_{000} - E \quad (28)$$

$$H_{ij} = u_{n'_i-n_j, m'_i-m_j, q'_i-q_j} \text{ if } |n'_i - n_j| \leq a; \quad (29)$$

$$|m'_i - m_j| \leq b \text{ and } |q'_i - q_j| \leq c$$

$$H_{ij} = 0 \text{ if } |n'_i - n_j| > a \quad (30)$$

or  $|m'_i - m_j| > b$  or  $|q'_i - q_j| > c$

### 3. Using of Orthogonal Polynomials

Let us consider the Schrödinger equation with one variable (31), taking orthogonal Hermitian polynomials  $H_n$  as an example.

$$-R \frac{d^2 \Psi(x)}{dx^2} + U(x) \Psi(x) = E \Psi(x) \quad (31)$$

Let the potential energy be given as:

$$U(x) = \sum_{k=0}^m u_k H_k(x) \quad (32)$$

And we are looking for a wave function of the form:

$$\Psi(x) = \sum_{n=0}^{\infty} b_n H_n(x) e^{-\frac{1}{2}x^2} \quad (33)$$

We substitute (32) and (33) into (31):

$$\begin{aligned} & \sum_{n=0}^{\infty} \left( R \left( n + \frac{1}{2} \right) - E \right) b_n H_n(x) \\ & - \sum_{n=0}^{\infty} R n (n-1) b_n H_{n-2}(x) \\ & - \sum_{n=0}^{\infty} \frac{R}{4} b_n H_{n+2}(x) \\ & + \sum_{n=0}^{\infty} \sum_{k=0}^m u_k b_n H_n(x) H_k(x) = 0 \end{aligned} \quad (34)$$

Using the orthogonality of Hermitian polynomials, we can write:

$$\begin{aligned} H_n(x) H_k(x) &= \sum_{l=|n-k|, 2}^{n+k} c_{l,n,k} H_l(x); \\ c_{l,n,k} &= \int_{-\infty}^{\infty} H_n(x) H_k(x) H_l(x) e^{-\frac{1}{2}x^2} dx \end{aligned} \quad (35)$$

As a result, Equation (34) takes the form:

$$\begin{aligned} & \sum_{n=0}^{\infty} \left( R \left( n + \frac{1}{2} \right) - E \right) b_n H_n(x) - \sum_{n=0}^{\infty} R n (n-1) b_n H_{n-2}(x) \\ & - \sum_{n=0}^{\infty} \frac{R}{4} b_n H_{n+2}(x) + \sum_{n=0}^{\infty} \sum_{k=0}^m \sum_{l=|n-k|, 2}^{n+k} c_{l,n,k} u_k b_n H_l(x) = 0 \end{aligned} \quad (36)$$

Taking the coefficients for  $H_{n'}$ , we construct a matrix with the dimensions  $(h+1) \times (h+1)$ . In the second term of Equation (36) we must assume

$$n-2 = n' \Rightarrow n = n' + 2,$$

in the third term we assume  $n+2 = n' \Rightarrow n = n' - 2$ , and in the fourth  $-l = n'$ . Instead of (36), we get:

$$\begin{aligned} & \left( R \left( n' + \frac{1}{2} \right) - E \right) b_{n'} H_{n'}(x) \\ & - R(n'+2)(n'+1) b_{n'+2} H_{n'+2}(x) \\ & - \frac{R}{4} b_{n'-2} H_{n'-2}(x) + \sum_{n=0}^h \sum_k c_{n'nk} H_{n'}(x) b_n u_k = 0 \end{aligned} \quad (37)$$

As previously, the index  $n'$  numbers rows of the Hamiltonian matrix, whereas the index  $n$  numbers its columns. Let an order of indices in the column vector of the wave function be so that a form of the transposed vector is given by:

$$\|\tilde{b}\| = \langle b_0; b_1; \dots; b_h \rangle \quad (38)$$

In a similar way we will number rows of the Hamiltonian matrix from top to bottom from 0 to  $h$  per unity. According to Equation (37), at the first stage we can fill the Hamiltonian matrix with the elements existing for

representation of the potential energy in the form  $c_{n'nk} u_k$  by the following principle:

$$H_{n'n} = \sum_k c_{n'nk} u_k \quad (39)$$

Summation in (39) is over all the existing indices  $k$  for the specified index pair  $(n', n)$ . Next, to every diagonal element  $H_{n'n'}$  we add  $(n' + \frac{1}{2})R$  and to every element of the diagonal, parallel to the main diagonal and positioned above it as a next nearest  $(H_{n',n'+2})$ , we add  $-(n'+2)(n'+1)R$ . And in the case of a similar diagonal positioned as a next nearest below  $(H_{n',n'-2})$  we add  $-\frac{1}{4}R$ . So, diagonal elements take the form:

$$H_{n'n'} = \left( n' + \frac{1}{2} \right) R + \sum_k c_{n'n'k} u_k \quad (40)$$

Nondiagonal elements are of the form:

$$H_{n'n'+2} = -(n'+2)(n'+1)R + \sum_k c_{n',n'+2,k} u_k \quad (41)$$

$$H_{n'n'-2} = -\frac{1}{4}R + \sum_k c_{n',n'-2,k} u_k \quad (42)$$

The remaining nondiagonal elements are as (39). Using the ordinary indices  $i, j$  varying from 1 to  $h+1$ , we can rewrite this algorithm as:

$$H_{ii} = \left( i - \frac{1}{2} \right) R + \sum_k c_{i-1,i-1,k} u_k \quad (43)$$

$$H_{i,i+2} = -(i+1)iR + \sum_k c_{i-1,i+1,k} u_k \quad (44)$$

$$H_{i,i-2} = -\frac{1}{4}R + \sum_k c_{i-1,i-3,k} u_k \quad (45)$$

$$H_{ij} = \sum_k c_{i-1,j-1,k} u_k \quad (46)$$

Finally, we consider Equation (3), trying to construct the Hamiltonian matrix with the use of Hermitian polynomials as basis functions. Let the potential energy be represented as:

$$U(x, y, z) = \sum_{k,l,m=0}^{a,b,c} u_{klm} H_k(x) H_l(y) H_m(z); \quad (47)$$

$$a, b, c \in N$$

A wave function is derived as follows:

$$\Psi(x, y, z) = \sum_{n,s=0}^{\infty} b_{n's} H_n(x) H_s(z) e^{-\frac{r^2}{2}}; \quad (48)$$

$$r^2 = x^2 + y^2 + z^2$$

Substituting (47) and (48) into (3), we obtain:

$$\begin{aligned}
 & \sum_{n,s=0}^{\infty} \left( R \left( n+t+s+\frac{3}{2} \right) - E \right) b_{n,s} H_n(x) H_t(y) H_s(z) \\
 & - \sum_{n,s=0}^{\infty} R n(n-1) b_{n,s} H_{n-2}(x) H_t(y) H_s(z) \\
 & - \sum_{n,s=0}^{\infty} R t(t-1) b_{n,s} H_n(x) H_{t-2}(y) H_s(z) \\
 & - \sum_{n,s=0}^{\infty} R s(s-1) b_{n,s} H_n(x) H_t(y) H_{s-2}(z) \\
 & - \sum_{n,s=0}^{\infty} \frac{R}{4} b_{n,s} H_{n+2}(x) H_t(y) H_s(z) \\
 & - \sum_{n,s=0}^{\infty} \frac{R}{4} b_{n,s} H_n(x) H_{t+2}(y) H_s(z) \\
 & - \sum_{n,s=0}^{\infty} \frac{R}{4} b_{n,s} H_n(x) H_t(y) H_{s+2}(z) \\
 & + \sum_{n,s=0}^{\infty} \sum_{k,l,m=0}^{abc} \sum_{f,h,r} c_{fnk} c_{htl} c_{rsm} b_{n,s} u_{klm} H_f(x) H_h(y) H_r(z) = 0
 \end{aligned} \tag{49}$$

Suppose that we need to construct a matrix with the dimensions  $(d+1) \times (d+1)$ . We determine coefficients for the factor  $H_{n'}(x)H_{t'}(y)H_{s'}(z)$ :

$$\begin{aligned}
 & \left( R \left( n'+t'+s'+\frac{3}{2} \right) - E \right) b_{n',t',s'} H_{n'}(x) H_{t'}(y) H_{s'}(z) \\
 & - R(n'+2)(n'+1) b_{n'+2,t',s'} H_{n'}(x) H_{t'}(y) H_{s'}(z) \\
 & - R(t'+2)(t'+1) b_{n',t'+2,s'} H_{n'}(x) H_{t'}(y) H_{s'}(z) \\
 & - R(s'+2)(s'+1) b_{n',t',s'+2} H_{n'}(x) H_{t'}(y) H_{s'}(z) \\
 & - \frac{R}{4} b_{n'-2,t',s'} H_{n'}(x) H_{t'}(y) H_{s'}(z) \\
 & - \frac{R}{4} b_{n',t'-2,s'} H_{n'}(x) H_{t'}(y) H_{s'}(z) \\
 & - \frac{R}{4} b_{n',t',s'-2} H_{n'}(x) H_{t'}(y) H_{s'}(z) \\
 & + \sum_{n,s=0}^d \sum_{k,l,m} c_{n'nk} c_{t'tl} c_{s'sm} b_{n,s} u_{klm} H_{n'}(x) H_{t'}(y) H_{s'}(z) = 0
 \end{aligned} \tag{50}$$

This expression may be rewritten as follows:

$$\begin{aligned}
 & \left( R \left( n'+t'+s'+\frac{3}{2} \right) - E \right) b_{n',t',s'} H_{n'}(x) \\
 & - R(n'+2)(n'+1) b_{n'+2,t',s'} - R(t'+2)(t'+1) b_{n',t'+2,s'} \\
 & - R(s'+2)(s'+1) b_{n',t',s'+2} - \frac{R}{4} b_{n'-2,t',s'} - \frac{R}{4} b_{n',t'-2,s'} \\
 & - \frac{R}{4} b_{n',t',s'-2} + \sum_{n,s=0}^d \sum_{k,l,m} c_{n'nk} c_{t'tl} c_{s'sm} b_{n,s} u_{klm} = 0
 \end{aligned} \tag{51}$$

We fix an order of the coefficients  $b_{n,s}$  in the column vector of the wave function defined by Equation (48). For example, if  $d=2$ , the transposed column vector

may be of the form:

$$\begin{aligned}
 \|\tilde{b}\| = & \langle b_{0,0,0}; b_{0,0,1}; b_{0,0,2}; b_{0,1,0}; b_{0,1,1}; b_{0,1,2}; b_{0,2,0}; b_{0,2,1}; \\
 & b_{0,2,2}; b_{1,0,0}; b_{1,0,1}; b_{1,0,2}; b_{1,1,0}; b_{1,1,1}; b_{1,1,2}; b_{1,2,0}; b_{1,2,1}; b_{1,2,2}; \\
 & b_{2,0,0}; b_{2,0,1}; b_{2,0,2}; b_{2,1,0}; b_{2,1,1}; b_{2,1,2}; b_{2,2,0}; b_{2,2,1}; b_{2,2,2} \rangle
 \end{aligned} \tag{52}$$

Let us assume that a change in three indices  $(n',t',s')$  numbering rows of the Hamiltonian matrix is in the same order from top to bottom. The matrix element  $H$  is numbered by a pair of three indices  $H_{(n',t',s'),(n,t,s)}$ . As earlier, first we can fill the Hamiltonian matrix with the existing elements representing the potential energy of the form  $c_{n'nk}c_{t'tl}c_{s'sm}u_{klm}$  by the following principle:

$$H_{(n',t',s'),(n,t,s)} = \sum_{klm} c_{n'nk}c_{t'tl}c_{s'sm}u_{klm} \tag{53}$$

Summation in Equation (53) is performed over all the existing triples  $(k,l,m)$  for the pair of the specified triples  $(n',t',s')$  and  $(n,t,s)$ . For the main diagonal  $H_{(n',t',s'),(n',t',s')}$  we must add  $(n'+t'+s'+\frac{3}{2})R$ . To the

nondiagonal elements of the form  $H_{(n',t',s'),(n'+2,t',s')}$ ;  $H_{(n',t',s'),(n',t',s'+2)}$  we must add  $-R(n'+2)(n'+1)$ ;  $-R(t'+2)(t'+1)$ , and  $-R(s'+2)(s'+1)$ . Finally, to the diagonal elements of the form  $H_{(n',t',s'),(n'-2,t',s')}$ ;  $H_{(n',t',s'),(n',t'-2,s')}$  and  $H_{(n',t',s'),(n',t',s'-2)}$  we must add  $-\frac{1}{4}R$ . Thus, we have:

$$\begin{aligned}
 H_{(n',t',s'),(n',t',s')} = & \left( n'+t'+s'+\frac{3}{2} \right) R \\
 & + \sum_{klm} c_{n'nk}c_{t'tl}c_{s'sm}u_{klm}
 \end{aligned} \tag{54}$$

$$\begin{aligned}
 H_{(n',t',s'),(n'+2,t',s')} = & \sum_{klm} c_{n'n+2,k}c_{t'tl}c_{s'sm}u_{klm} \\
 & - R(n'+2)(n'+1)
 \end{aligned} \tag{55}$$

$$\begin{aligned}
 H_{(n',t',s'),(n',t'+2,s')} = & \sum_{klm} c_{n'nk}c_{t',t+2,l}c_{s'sm}u_{klm} \\
 & - R(t'+2)(t'+1)
 \end{aligned} \tag{56}$$

$$\begin{aligned}
 H_{(n',t',s'),(n',t',s'+2)} = & \sum_{klm} c_{n'nk}c_{t'tl}c_{s',s'+2,m}u_{klm} \\
 & - R(s'+2)(s'+1)
 \end{aligned} \tag{57}$$

$$H_{(n',t',s'),(n'-2,t',s')} = \sum_{klm} c_{n'-2,n',k}c_{t'tl}c_{s'sm}u_{klm} - \frac{1}{4}R \tag{58}$$

$$H_{(n',t',s'),(n',t'-2,s')} = \sum_{klm} c_{n'nk}c_{t',t-2,l}c_{s'sm}u_{klm} - \frac{1}{4}R \tag{59}$$

$$H_{(n',t',s'),(n',t',s'-2)} = \sum_{klm} c_{n'nk}c_{t'tl}c_{s'sm}u_{klm} - \frac{1}{4}R \tag{60}$$

In other cases, we have (53). Now numbering the matrix elements of  $H$  by the ordinary indices  $(i,j)$  each of

which is varying from 1 to  $(2d+1)^3$ , we have to establish for them a one-to-one correspondence to three numbers according to the principle:  $i \Leftrightarrow (n'_i, t'_i, s'_i)$ ;  $j \Leftrightarrow (n_j, t_j, s_j)$ . Specifically, in the case given by (52) for  $i=5$  we have  $n'_5=0$ ;  $t'_5=1$ ;  $s'_5=1$ , and for  $j=17$  we have  $n_{17}=1$ ;  $t_{17}=2$ ;  $s_{17}=1$ . Then an algorithm to construct the matrix  $H_{ij}$  under condition of (52) takes the following form:

$$H_{ii} = \left( n'_i + t'_i + s'_i + \frac{3}{2} \right) R + \sum_{klm} c_{n'_i n'_i k} c_{t'_i t'_i l} c_{s'_i s'_i m} u_{klm}; \quad (61)$$

$$H_{i,i+18} = \sum_{klm} c_{n'_i n'_{i+18,k}} c_{t'_i t'_{i+6,l}} c_{s'_i s'_i m} u_{klm} - R(n'_i + 2)(n'_i + 1); \quad (62)$$

$i = 1-9$ ;

$$H_{i,i+6} = \sum_{klm} c_{n'_i n'_i k} c_{t'_i t'_{i+6,l}} c_{s'_i s'_i m} u_{klm} - R(t' + 2)(t' + 1); \quad (63)$$

$i = 1-3; 10-12; 19-21$ ;

$$H_{i,i+2} = \sum_{klm} c_{n'_i n'_i k} c_{t'_i t'_i l} c_{s'_i s'_{i+2,m}} u_{klm} - R(s' + 2)(s' + 1); \quad (64)$$

$i = 1, 4, 7, 10, 13, 16, 19, 22, 25$ ;

$$H_{i+18,i} = \sum_{klm} c_{n'_i n'_{i-18,k}} c_{t'_i t'_i l} c_{s'_i s'_i m} u_{klm} - \frac{1}{4} R; \quad i = 1-9; \quad (65)$$

$$H_{i+6,i} = \sum_{klm} c_{n'_i n'_i k} c_{t'_i t'_{i-6,l}} c_{s'_i s'_i m} u_{klm} - \frac{1}{4} R; \quad (66)$$

$i = 1-3; 10-12; 19-21$ ;

$$H_{i+2,i} = \sum_{klm} c_{n'_i n'_i k} c_{t'_i t'_i l} c_{s'_i s'_{i-2,m}} u_{klm} - \frac{1}{4} R; \quad (67)$$

$i = 1, 4, 7, 10, 13, 16, 19, 22, 25$ ;

$$H_{i,j} = \sum_{klm} c_{n'_i n'_j k} c_{t'_i t'_j l} c_{s'_i s'_j m} u_{klm} \quad (68)$$

#### 4. Conclusion

In this way we have derived analytical expressions for elements of the Hamiltonian matrix describing the molecules characterized by motions with a large amplitude. The cases when the wave functions and potential energy are represented by Fourier series and orthogonal polynomials have been considered in detail taking Hermitian polynomials as an example. Some specific types of Schrödinger equations with a single variable or several variables have been treated.
